There is always more Coin received through private channels from the interior than is remitted in that way, and hence the figures of the Express Company do not correctly indicate tbe Coin movement between the city and country.

Colorado Mines.—Tbe Georgetown, (Col.,) *Miner*, in an able article on tbe mines and mining interest of Colorado, takes the following cheerful view of the situation:

We, in Clear Creek county, are having hard times, it is true; but the outlook is bright—was never brighter, and the reasou for the present stringency in our money market, is obvious. We want capital to develop our mines, and give us increased capacity for production. It is like trying to run a large store with a small stock of goods. Mining doesn't pay from tbe grass roots, and it takes money to put a mine in condition to make it pay. We have scores of mines in this country which are paying a bandsome profit; but with few exceptions they are owued and worked by individuals whose meaus are limited, and who put their profits into developing their property.

We will work onrselves out of all thie trouble by and by, however; and capitalists will sometime learn that mining is a legitimate business.

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains Grammes, will be sent free upon application.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Nevada Metallurgical Works.

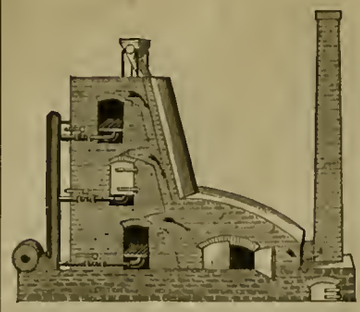
Platinum Scrap and Ore purchased.

EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

THOS. McGLEW & CO.

Austin, Nev., July 15, 1873. 6v27-tf

OAKLAND

SMELTING AND REFINING CO.

Is now ready to receive Lead Bullion and separate the Silver and Gold therefrom, and Refine the lead on reasonable terms, and have the same ready for delivery within thirty days from its receipt.

Their works are situated at Melrose, on the line of the Railroad, three and a half miles easterly from Oakland.

The Bullion will be received at the works, directly from the cars, free of expense.

THAT FAVORITE HOME REMEDY,

PAIN-KILLER,

Has been before the public over THIRTY YEARS, and probably has a wider and better reputation then any other proprietary medicine of the present day. At this period there are but few unacquainted with the merits of the PAIN-KILLER; but, while some extol it as a liniment, they know but little of its power in easing pain when taken internally; while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all, that it is equally successful, whether used internally or externally. It is sufficient evidence of its virtues as a standard medicine to know that it is now used in all parts of the world, and that its sale is constantly increasing. No curative agent has had such a widespread sale or given such universal satisfaction.

DAVIS' PAIN-KILLER is a purely vegetable combound, prepared from the best and purest materials, and with a care that insures the most perfect uniformity in the medicine; and while it is a most effective remedy for pain, it is a perfectly safe medicine, even in the most unskillful hands.

It is eminently a FAMILY MEDICINE; and by being kept ready for immediate resort, will save many an hour of suffering, and many a dollar in time and doctor's bills.

After over thirty years trial, it is still receiving the most unqualified testimonials to its virtues, from persons of the highest character and responsibility. Eminent Physicians commend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, etc., but for Dysentery, or Cholera, or any sort of bowel complsint, it is a remedy unsurpassed for efficiency and rapidity of actiou. In the great cities of India, and other hot climates, it has become the standard medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and all other kindred disorders, For Coughs and Colds, Canker, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine.

We would caution the public against all imitations of our preparation, either in name or style of putting up.

GENERAL MERCHANDISE.

The demand for Bags is quite large, rates being $14½ @15c. for standard. Prices of Coal are no higher, Monte Diablo selling at $6 50@8 50. The trade generally improving.

Leather Market Report.

[Reported for the PRESS by Dolliver & Bro.]

Prices remain much the same as of late, changes of importance seldom occurring except from violent fluctuations in the French market. Business this month is slightly better than that of the past two months, and Leather promises to soon recover from the recent depression.

SPECIAL NOTICE.

NEVADA, Cal., August 10, 1873.

DEWEY & Co.—Gents: I see in your paper of yesterday that Hoskins has stated another falsehood in regard to my being beaten in every suit that I have been party to. You will please take notice that the suit of Fisher vs. Craig is on trial and not decided yet. The injunction was denied, but the case goes on for trial. As I think you do not wish to misrepreseut the matter, you will please have it rectified. Respectfully,

F. H. FISHER.

Another Compliment.

STONY POINT, July 16, 1873.—Messrs. DEWEY & Co., Patent Agency—Dear Sirs: I received my patent for harrow on the 12th of this month, by Wells, Fargo & Co.'s Express, all in satisfactory order. I would say to those wishing to obtain patents to employ Messrs. DEWEY & Co. without fail. From my experience with them, I am satisfied from their untiring energy and honesty that if the case deserves a patent they will obtain it, and in full legal form. P. N. WOONWORTH.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS,
ALSO, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & Co., Publishers, and Patent Agents, S. F.

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE Co. J. B. Roberts, 315 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

WE WILL CHANGE THE ADDRESS FREE for any subscribe who notifies us in writing of his *new* address, with the OLD P. O. address to enable us to find his name among thousands of others.

Mining and Other Companies.

Alpine Gold Mill and Mining Company—

Location of principal place of business, San Francisco, California. Location of works, Tuckerville Mining District, Amador County, California.

Notice is hereby given, that at a meeting of the Directors, held on the 21st day of July, 1873, an assessment of Fifty Cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 438 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of August, 1873, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the 17th day of September, 1873, to pay the delinquent assesement, together with costs of advertising and expenses of sale. By order of the Board of Directors.

JOEL F. LIGHTNER, Secretary.

Office, No. 438 California street, San Francisco, California. ly26

Baltic Consolidated Gold and Silver Mining Company.

A meeting of the stockholders of the above named Company will be held at the office, 507 Montgomery street, on the 16th day of August, 1873, at 1 o'clock P. M., for the election of Trustees, and for such business as may come before the meeting.

aug5-2w ROBT. H. GOODWIN, Secretary.

Notice—The Annual Meeting of the

Stockholders of the Cerbat Consolidated Gold and Silver Mining Company for the election of Trustees for the ensuing year and the transaction of such other business as may properly come before the meeting will be held on Monday the eleventh day of August, 1873, at the office of the company, 507 Montgomery street, San Francisco, California, at 1 o'clock, P. M.

jy26td T. E. JEWELL, Secretary.

POSTPONEMENT.—The above meeting is hereby postponed thirty days, at the same place and hour.

T. E. JEWELL, Secretary.

Table Mountain Alpha Mining Company—

Location of principal place of business, San Francisco, California. Location of works, Table Mountain District, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Directors, held on the 8th day of August, 1873, an assessment (No. 1) of 12½ cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 438 California street, up etaire, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 16th day of September, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 7th day of October, 1873, to pay the delinquent assesement, together with costs of advertising and expenses of sale.

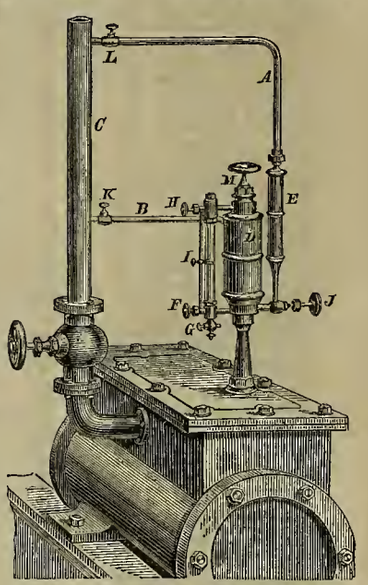
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of those patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

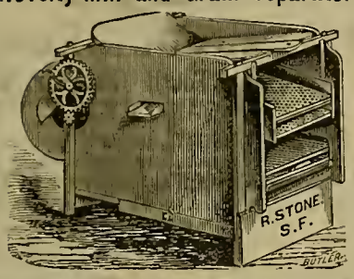
If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, Oakland,
Or WILLIAMSON & CORY, Marysville.

Dutch Flat, August 1, 1873. 6v27-2m

THE PATENT Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

R. STONE,

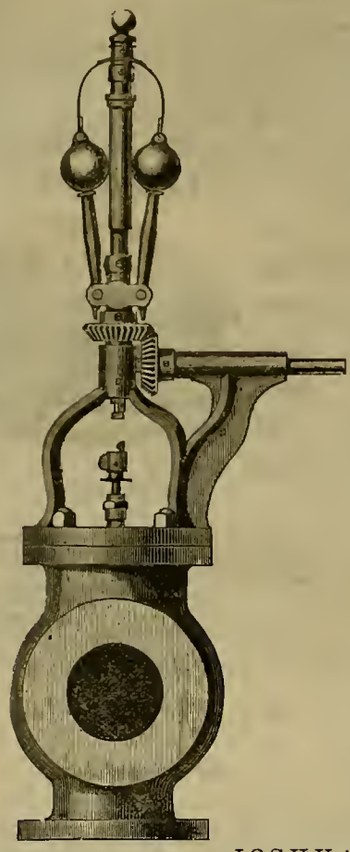
PURCHASERS please say advertised in Scientific Press.

HENDY'S IMPROVED STEAM ENGINE REGULATOR.

OVER 400 HAVE BEEN PUT IN USE.



RECOMMENDATION.

ST. PATRICK MILL, Placer Co., Feb. 10, 1873.

JOSHUA HENDY, ESQ., SAN FRANCISCO:

Dear Sir: We, the undersigned, take pleasure in giving you the following testimonial as to the merits of the Hendy Governor, which we ordered from you about four months ago. Though more than pleased with its workings at first, we deferred writing until we had tested it thoroughly.

Our engine is 12x36 (carrying 70 lbs. of steam), driving 15 stamps, 725 lbs. each; 1 Wheeler Pan, 1 Knox Pan, 6 Hendy Concentrators. The discarded Governor was the common "Arm and Ball Governor;" it giving but poor satisfaction, we decided to try the "HENDY," and are pleased to report in its favor for the following reasons:

1st. IT SAVES ITS FUEL. Previous to attaching your Governor we were burning 3½ cords of wood per 24 hours. We now consume but 2½ cords doing the same work.

2d. FOR SAFETY. The "trip" saved us from an expensive smash up but a few days ago, during the temporary absence of our engineer. The Governor belt ran off the Pulleys. Your little automatic trip worked like a charm, and but one or two revolutions was the result, and no damage. Had we been using any other Governor, the probability is that we would not have had a whole cam in the mill.

3d. IT IS A PERFECT GOVERNOR. We can turn off the Wheeler Pan and hang up one-third of our stamps, without any perceptible change in speed.

4th. THE ADJUSTMENT for regulating the speed without increasing or reducing the size of our Governor pulley, is admirable, and as easily managed as setting a clock.

5th. IT IS SIMPLE and not liable to get out of order, or requiring more than ordinary care.

Yours respectfully,

JAS. H. CROSSMAN, Supt.
GEO. H. BARNEY, Chief Eng'r.

To Capitalists and Hydraulic Miners.

PATENT SELF-CLEANING SLUICE.

This new and useful invention is designed to collect all the gold as fast as it is set free from the dissolving earth, and conduct it into a receptacle of mercury or safety pocket, under lock and key, from whence it may be removed in a few moments, without either checking the flow of water or interfering in the least with the washing.

The invention, if properly placed in our rivers, will also collect the gold which is yearly traveling down their channels, thus affording an annual income with a trifling expense for attending.

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' conetant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of varlous sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven hy steam above ground. The Burleigh Air Compressor is the hest engine yet devised for furnishing the "air motor" for the many purposes to which it is now heing used.

They are to he nsed on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and worke:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Rochling .....East River Bridge Company, N. Y.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Oree, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of traneportation; and to the annexed certificatee in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francieco, it givee me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up hy you upon our mine in Freihurg.

It is a perfect success, discharging ten tone of ore per hour with two men's labor. It ie perfectly simple in constructiou, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requiree hut about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrylng capacity might he doubled or qnadrupled if deeired. After eeveral weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If thie can he of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may he on acconnt of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 25, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,

113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

VOLUME XXVII. Number 8.

Improved Telemeter for Engineering and Military Purposes.

At the meeting of the California Academy of Sciences held July 21st, Prof. Geo. Davidson exhibited drawings of an improved telemeter for determining the distance, hearing and difference of elevation of an object from the observer by means within the instrument itself. Through the courtesy of the committee of publication we are able to make the following summary of his description:

The fundamental idea of this telemeter is credited to Gen. Clerk, R. A., F. R. S., etc., who designed it for military purposes, and had one, of two feet in length, made by Pastorelli & Co., of London, (Engineering for November 15, 1872, p. 333, Vol. II,) with a mirror at each end and two in the center. With the micrometer eye-piece he "obtained great accuracy up to 600 feet distance," and the results were "tolerably certain up to 3,000 feet." A similar instrument of six feet in length gave good results at three thousand yards.

The improvement which Prof. Davidson has made, in addition to some matters of detail, is what may be called a repeating micrometer, with a screw of much finer thread than used in the above instruments, where one Micrometer division was eleven seconds of arc. In the Micrometers of the Coast Survey, field Transits and Zenith Telescopes, the Micrometer divisions range from four-tenths of a second of arc to six-tenths, and are read to one-tenth of a division or six-hundredths of a second of arc. For work with this instrument the micrometer may be divided to seconds of arc, and read to half seconds or less.

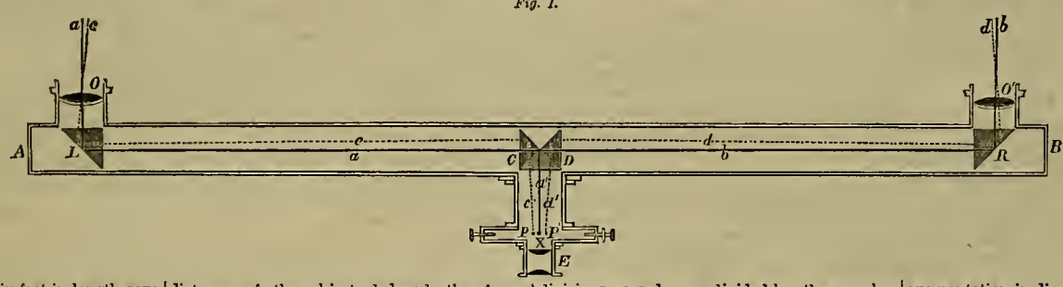
Description of the Instrument.

Figure 1, exhibits without details of bars or adjustment, a plan of the tube *A B*, carrying the base bar of six feet, the object glasses *O* and *O'* of two telescopes with micrometer eye piece *E*, common to both, and the prisms *L R*, and *C, D*. This tube will be about three inches in diameter; the object glass the same, and the powers of the eye glass from twenty to fifty. An opening can be made in the center of the tube in front of the prisms for illumination at night; and above the eye tube a short outside director to rapidly obtain the direction of the object to be observed upon.

Instead of reflectors, right angled prisms are prepared and arranged for each telescope, with their hypothenusal sides parallel to each other at an angle of forty-five degrees with the base. Necessarily the central prisms *C*, and *D*, are placed one above the other but touching. With this arrangement a ray of light from an infinite distance, or from a star, after entering the object glass *O* follows the direction of the line *a, a, a'*, in the left hand telescope to the point *X* in the focus of the telescope, and also entering *O'*, follows the line *b, b, c'*, in the right hand telescope to the same point. If the prisms are in adjustment the image of a star through each telescope will be seen as a single object at *X*. And this last condition is the test of adjustment. In using a star the adjustment would necessarily be made at night, but the test could be frequently made during the day by similar observations upon the border of the sun or upon some well marked spot on its disc. If it is desired to test the adjustment upon a near object, say at one hundred yards, then after the adjustment upon a star or the sun, the micrometer difference of the two images of an object at that distance must be determined (or may be computed) and used thereafter as a constant from which to make the necessary adjustment for infinite distance. But this method would require the change of focus of the telescope whence would arise change of the arc value of the micrometer divisions.

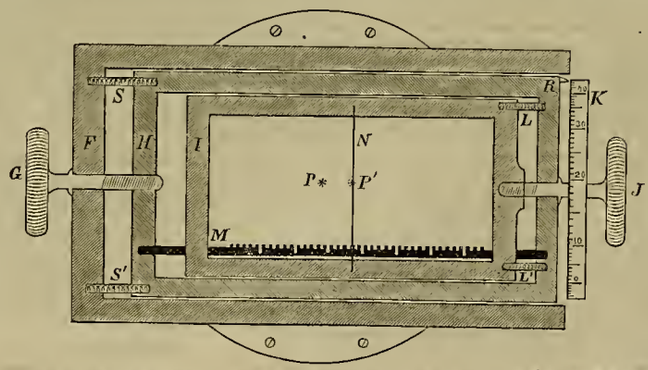
If the prisms are in adjustment and the object observed upon is not at an infinite distance, the rays of light from it will not enter the two object glasses in parallel lines, but at angles varying with a function of the distance, and will follow the lines *c c c'* and *d d d'*, so that the images *P* and *P'* of the same object will be formed at the common focus of the two telescopes. The horizontal distance apart of these images is measured by the micrometer, and the distance of the object deduced therefrom.

Fig. I.



With the ordinary micrometer this separation of the images can be measured by single readings only, but with the proposed micrometer the measure may be repeated any number of times, thereby virtually increasing the length of base used, by each repetition. Thus, by repeating the measure ten times, we have, as it were, increased the case from six to sixty feet; whilst a second set of ten repetitions serve not only as a test of the first set, but give an accuracy approximating that obtainable with a base of one hundred and twenty feet.

Fig. II.



IMPROVED TELEMETER FOR ENGINEERING AND MILITARY PURPOSES.

Figure II exhibits the repeating micrometer which essentially consists of three frames. The first, *F*, is attached by screws to the eye tube of the telescope. At the left hand end it carries a moderately fine micrometer screw, *G*, which moves the two frames *H*, and *I*, which are themselves attached to each other by the fine micrometer screw *J*, bearing the micrometer head *K*, and carrying the micrometer thread *N*. The springs *S* and *S'* between *F* and *H* are for keeping a constant strain between the two frames; and the springs *L*, and *L'*, between *H* and *I* are for a similar purpose. The frame *H*, carries the micrometer rack *M*, by which the whole turns or revolutions of the micrometer head of *J* are noted.

The action of the micrometer is therefore readily seen, and the operation of observing is as follows:

P and *P'* (in both figures) are the two images of the object to be observed upon. The micro meter *J* may be turned until the zero of the head is opposite the pointer *R*, then the micrometer *G* is turned (moving frames *H* and *I*) until the thread *N* bisects the left hand image *P*; the micrometer *J*, is then turned, moving the rack *I* only, until the thread *N*, bisects the right hand object *P'*, and the micrometer read off for the divisions less than one hundred, whilst the whole turns are noted on the rack which has a notch for each turn of the micrometer; this difference of the two readings gives the distance apart of the two images of the object in terms of the micrometer, and constitutes one measure. The micrometer *G* is now turned and carries both frames *H* and *I* until the thread *N* is brought back to bisect the image *P*; then the micrometer *J* is turned until the thread *N* bisects *P'* and read off as before for a second measurement. And so for subsequent measures. The measures can be read off after each repetition; or in rapid work, only the readings of the first bisection, and the last in a set, and the micrometer divisions passed over, divided by the number of repetitions. And any number of sets may be made to test or increase the accuracy of the work.

If the images of the object to be observed upon are small, clear and sharply defined, the probable error of the individual micrometer measures, should not exceed half a second of arc, but on account of the lack of definiteness and sharpness of most terrestrial objects this probable error will be larger; nevertheless it is perhaps a large allowance to assume that a probable error of one second of arc may exist in the mean of ten repetitions. At the distance of one mile this would involve an error of little more than two feet; and at five miles of only fifty-five feet.

Of course another function of the accuracy of the distance, is the accuracy of the base bar itself in the instrument, but this can be obtained with great precision. And as the base changes its length by changes of temperature, tables of distances for a series of micrometer differences with the base bar at different temperatures can be readily constructed.

Upon the upper and middle part of the bar tube a small prismatic compass was placed by General Clerk to obtain the magnetic bearing of the object. In addition to this Prof. Davidson proposes to place a small vertical arc and attached level to give the angle of inclination, by which, with the distance, the difference of hight between the object and observer may be obtained.

SILVER CITY, Idaho, is in a prosperous condition. The mines are said to be looking better than ever and the mills are pounding away day and night.

Improvement in Feathering Paddle Wheels.

From the first introduction of steam navigation all have recognized the many disadvantages of the existing system of paddle wheels and the great advantages of "feathering" wheels, that is, wheels with buckets which are maintained in a vertical position while in the water. The fixed buckets of the simple wheel enter the water at a resisting angle, slapping it, and causing a continuous jar and vibration of the whole machinery and frame of the vessel. But the most serious inconvenience results from the buckets leaving the water in such a position as to carry upwards an immense dead weight of water, which causes an equivalent waste of steam power. To lessen as far as possible these objectionable features, builders are obliged to reduce the hight of the buckets and increase the diameter of the wheel, adding larger numbers of buckets with each augmentation in diameter. This, of course, increases the cost of construction, as more rims and braces are required. The plan, while diminishing the bad points of the fixed buckets can never entirely remove them, as is evident; and this it is that has placed the screw in advance of the wheel, more than any other cause.

Many very ingenious devices for self feathering buckets have been invented and patented. The difficulty with these is one of complication and attendant want of solidity. Mr. A. Lefebvre, a mechanic, residing at No. 720 Lombard street, San Francisco, believes that he has attained the desired end by a simple system, for which letters patent dated May 13th, 1873, have been issued, protecting the inventor in his claim for seventeen years. Great economy of steam and increased speed are expected to result from the use of the new model. On Mr. Lefebvre's system, with the same size of bucket, the diameter of the wheel will be reduced one-half. The number of buckets can also be diminished, and the width of wheel made less. Narrow wheels give more space in the interior of the ship, or less extension in exterior or outside beam measurement. Nothing in the mechanism of the feathering wheel interferes with the present style of construction, but is claimed to add strength. The inventor guarantees that his plan applied to wheels will enable them to resist heavy seas, and will prove of economy in all directions in ocean and river navigation. The models which can be seen at Liesenfeld's Billiard Manufactory, No. 571 Market street, is essentially the same in fundamental construction as those made for the Pacific Mail S. S. Co.'s ships, on the 32nd proportion of the regular model.

NEW SMELTING WORKS.—We see by the Black Hawk *Journal*, that the new smelting works of the Boston and Colorado company, at Alma, are now in successful operation. They start with 1,000 tons of ore on hand, representing purchases amounting to $150,000.

THE Carson River is getting lower every day, much to the disgust of mill men and mine owners. Numbers of men have already been discharged, as the mills can not run all their stamps and some have "hung up" altogether.

CORRESPONDENCE.

Notes of Travel in White Pine County Nevada.—Continued.

[By our Traveling Correspondent.]

Tea-Cup Mine,

This location, consisting of 1,500 feet, Hunter Safford & Co., owners, is the commencing point of an entirely different ledge formation from either of the above mentioned. It begins at a point midway between the Delta and the Mountain View; it runs in a direction nearly north and south, and dips to the west. The hanging wall is a slate shale, 300 feet thick; the foot-wall, limestone. The development upon this mine consists of an incline shaft snnk to a deptb of 90 feet, following the incline of tbe ledge. At the bottom of this shaft they havo a body of ore three feet thick; having only the hanging wall in sight, the ledge matter is not known. At a depth of 50 feet on the incline, a body of ore over five feet thick is in sight; the company have on their dumps about 40 tons of ore that will mill over $80 per ton. The charscter of the ore is similar to that of the Pine Nut mine, described above.

The next claim is the McGary mine, an undeveloped location, owned by some six parties; it contains 1,500 feet. Next adjoining the McGary on the north is the

Chance Mine,

Owned by Curtis, McGary & Co; it coutains the same nnmber of feet as the Tea Cup mine. This mine is looked upon with considerable favor in Cherry Creek district. The development consists of one shaft down 45 feet, and an incline down 20 feet, following the dip of the ore body, which is the same as in tbe "Tea Cup." In the incline, an ore body is exposed over 3 feet wide of a very fine character. Tberc are now 50 tons of ore on the dnmps of this Co., that were extracted in sinking the incline shaft and incline, tbat will pay from $30 to $4,000 per ton. The ledge matter on the croppings shows an average width of over 15 feet. Exteuding north from the Chance mine, there are some six other locations between it and the Baltic, among which are the Vulcsn and Wanderer No. 2. But little development has been made on either of them.

The Baltic Mine,

Located on the same belt as the Tea-Cup mine; but situated 2⅓ miles north of it, at the upper or extreme west end of Silver Cañon, and at an elevation of over 8,000, feet. This location is owned by Messrs. Wbitemau, Masey and Goodrich. The claim is 1,500 feet in extent, running north and soutb, and dipping to the west at an angle of abont 50°. The development on this mine, consists of an open cut, run acress the vein near the center for about 50 feet; at this point the ledge is full 60 feet between the walls, all sbowing more or less mineral. Some 30 tons of pay ore have been taken out, and are now on the company's dump. This is divided into tbree classes; the first class ore will mill from $300 to $500; tbe second class $80, per ton; the tbird class, paying less than $80 per tou, is thrown over the dump.

At the north end of this location, a shaft is sunk to a depth of about 20 feet. In sinking tbe shaft, a body of chloride ore 8 feet thick was exposed, assays from which sbow it to contain $120 in silver and $25 per ton in gold. About 10 tons of this ore are now on the dump, at the North Shaft. This mine is now under lease to Capt. Henry Cheever of your city, with privilege to purchase.

Silver Cañon, in which the above claim is located, contains some of the finest timber to be found in Eastern Nevada. Next to tbe Baltic on the north is the

Wanderer Mine,

The property of Smith, McPherson, Martin and Wilson. These gentlemen claim 1,500 feet on the north of the Bsltic. The development on the same consists of a sbaft sunk to a depth of 25 feet, and at a point about 400 feet from their south line. This shaft is sunk on a line with their foot wall, and shows a body of ore of high grade, the entire width of the sbaft. Tbe width of their ledge at this point, on the croppings abont 20 feet, in every otber respect, it is similar to the Baltic mine, above described. The Wanderer has 25 tons of ore on the dumps.

Fortuna Mine.

This mine is located about 300 feet northeast of the Tea-Cup mine, and upon a parallel ledge, aud still different from either of the above described. This location contains 900 feet on the ledge, and is owned hy the Messrs. Collins & Franks. The ore body is between walls of limestone, and shows an average width of 3 feet. The company have run an open cut upon tbeir ledge, and sunk a sbaft 35 feet deep, taking out about 20 tons of ore, which are now on their dumps. It is expected to average $100 per ton.

Star Mine

This location is 1,500 feet in length and isthe property of Messrs. Moore & Johnson. It is situated in the quartzite, about ¼ of a mile east of the Exchequer and below and east of all of the above mentioned mines. It has been worked but slightly, but enough to reveal an ore body 3 feet thick, similar in character to that of the Exchequer. Some 4 miles south of Cherry Creek is another mining district that has heen known and worked for the last 8 or 10 years, known as, and located in

Egan Canon.

The mines in this district were first discovered in 1863. Two companies were at work in 1865, the Social Co., and the Steptoe Mining Co., which were consolidsted in 1866. The principal mine that has been worked since tbat time is the Gilligan, which has a shaft down 460 feet with levels run east 500 feet, and west 450 feet from the 300 foot level, where it connects with the air shaft; both shafts are inclines run down upon the ledge, which is remarkably well defined. The hanging wall is slate and the foot wall of quartzite, which are cut in a remarkably smooth manner, looking in places as though they had been plastered. There is a five stamp mill belonging to the company, which during the prospecting of the mine milled about $80,000 out of this rock, paying all expenses. The water came in at a point where the ledge was broken at a depth of 360 feet, and drove them out.

A twenty stamp mill was erected, bnt the ore was found to require roasting; while awaiting the erection of a furnace, the mine changed hands and is now being worked by a corporation known as the San José Co. A drift was run into the hill 50 feet below the break, and the ledge found again. The incline was continued down 90 feet, the water being kept down by steam pumps, and a drift run for the ledge, which when struck, opened snch a vein of water that tbe pumps became useless. The work is now snspended awaiting larger pumps.

Schell Creek District.

This district comprises the towns of Schellbourne, Ruby Hill and Centerville. The larger of the three places is Schellbourne. At this writing it is extremely dull, and has less than one hundred inhabitants. It is located in White Pine county, Nevada, and distant 95 miles from Hamilton, the county seat, and 110 miles south of Wells' Station on the C. P. R. R., betweeu which places Woodruff & Ennor's stages ply twice a day, making tbe trip in 48 honrs. The fare is $20. The cause of the failure of this district, (if failure it is,) can be summed up in two transactious, the first of whicb was the bonding of all the principal mines on

Ruby Hill,

To Col. O'Connor Sidney (since deceased) who became involved with English capitalists to such an extent that Mr. Thos. Snowdon was sent out to take charge of these mines as their property. Lawsuit after lawsuit has been the result, and it is still in litigation. Tbe town of Ruby Hill ss a natural result, became depopulated, and those having other locations that were good could not dispose of them, nor induce capital to come to their aid. I venture the assertion that there are to-day just as good mines to the extent of their development at Ruby Hill as anywhere in the new districts of Eastern Nevada. Tbe second and principal cause of the failure was the sale of the

Tehama Property

To Treat, Boggs, Richardson & Co., for $28,500; and they spent $75,000 more for a 30 stamp mill, before they had prospected to a sufficient depth to know that they had a mine.

I do not mention this by way of censure, for any man or compsny has the privilege and right to spend his money as he sees fit. But I do say that if $28,000 only, had been thrown away, instead of over $100,000, to-day a quarter of a million more would be operating there, iustead of being frightened entirely away from the district. I have written the above in partial justification of myself, as one of your Eastern contemporaries saw fit to twit you about your correspondent from here last year. I have surveyed the diffcrent points questioned (on this trip) of my remarks last year—and find nothing to take back. The fact that this Tehama Property did not prove a suc ess is of little import; I did not say it wonld; I did say that there was rock in sight that would pay certain figures, and snch was the case. This location, it appears, proves to be a slide of ore from some point higher up in the mountain, and is very rich on the croppings, which were from 10 to 60 ft. wide, hut only went down from a few inches to 4 or 5 ft. The Queen Springs mines, the Nutmeg and the McMahon are still driving abead, and extracting some good ore. From Robinson District in my next.

Robinson District.

This mining district is about ten miles long by eigbt wide, the lengtb being east and west. The mineral-bearing ground lies on both sides of a small valley which has the same name as the district. Tbe ores found here are quite numerous. I will mention some of them in order of prominence: silver (chloride and bromide), gold (telluride and free), lead, copper, iron and graphite. But small quantities of the two latter substances are found. Black and red garnets are fonnd in profusion, some of them are very beautiful. In the center of Robinson District is

Mineral City,

A place of about 250 inhabitants. This town began its existeuce in April, 1872. Discoveries, however, were made in 1868. There are four mercantile firms in this place, three boarding and lodging houses, two blacksmiths, two livery stables and some half a dozen saloons. There are also a ten stamp quartz mill and a smelting furnace in course of erection. A public school was started three months ago. The town has nearly doubled in size since last year. The mines never looked so prosperous as now, through the scarcity of money makes it rather dull here. Following are the principal mines of the district, with their present state of development:

Canton M. Co.

This is an Ohio incorporation. Mr. G. M. Ogden is Superiutendent. Tbe company own some forty different locatious or ledges The following are the principal, and developed more or less: Minnie-Minora, Blackstone, Yellowstone, New York, Springfield, El Dorado, Randolph, Hayes Extension and Aultman. The latter is the most thoroughly developed, and has the largest body of ore in sight underground of any mine I have ever been in except those on the Comstock lode. The location known as the

Aultman Mine,

With its extensions, is 6,000 feet in length 2,200 in width, 1,500 feet of which, together with the mill site, is covered by U. S. patent. This claim is located on tbe south side of Robinson Valley, below Mineral City and in close proximity to the company's smelting works. Tbis mine is being deve'oped by a tunnel now in 750 feet, and about 200 feet below the croppings. In driviug this tuunel to its present deptb in the hill a body of low grade ore was passed through, 100 feet in extent, prospecting from $12 to $100 per ton. The tunnel is now 25 feet in limestone, and supposed to be within a few feet of the main chimney, or ore body, as revealed by the principal shaft, which is 150 feet deep where it intersects the tunnel, the last 80 feet of whicb were in ore that will pay about $35 per ton in gold and silver—containing rather more of the former. Only a trace of lead is found at tbis point. Ten other shafts are sunk on this claim and its extensions, varying from 30 to 130 feet in depth, with some 600 feet of drifts and cross-cuts, and ore in every direction explored. At present the workiugs show a body of ore from 200 to 225 feet wide and 350 to 400 feet long, with neither side nor bottom. There are now on the dumps of the Aultman about 4,000 tons of ore averaging $40 per ton. On the dumps of tbe

Mining Notes.

EDITORS PRESS:—Having a month's leisure time at my disposal, I coucluded to avail myself of the long coveted privilege of visiting some of the famous mining localities in Lassen, Butte, Yuba and Plumas counties. Tbe weather has been excessively hot and extremely unfavorable to active locomotion, hut I bave learned many valuable facts in swinging around a circle of three hundred miles, and I thought I would give the PRESS and its readers the beuefit of my observations.

Chico

Is a pretty town, rapidly improviug, hot as a furnace in the summer, but is the natural center of a wouderfully rich agricultural region, and is the most available depot, for the great Big Meadow lumber forest. In extent and magnitude of sngar, yellow and white pines, and other trees of the genus *Coniferæ*, tbis grand old forest has no equal in North America, and probably cannot be excelled in the world. As I have stated, Chico is a pretty plsce; is the popular rival of Oroville for county seat of Butte, and will probably carry off the honor, for Oroville is a finished city, has lived out its day of activity and usefulness, and does not deserve to be county seat, or have any other distinguishiug mark of local importauce. As an evidence of the lack of enterprise, they have, within a year past discovered near the town, a bed of marvelously rich placer diggings. Instead of trying to work tbese diggings, as men used to do in '49 and '50, they think it a big thing to snrvey, and sells the mining lots to Chinamen, at prices ranging from $10 to $200 per lot, from which the purchasing Celestial will wash out a thousand dollars in less than a week. I learned from the bankers at Marysville and Oroville, that the Chinese ship regularly from this locality an average of $18,000 per week in fine gold. Is it surprising that Oroville is in its decadence? The life and soul of Butte county are the amazingly

Colossal Works

Which are being carried on in the famous tertiary beds at Cherokee, and at Morris Ravine. These great placers, nnderlying what is known as Table Mountain, extend from Oroville to Dogtown, in the direction, north and south, fully twenty miles, and are nnquestionably the most extensive placer gold deposits in the world. The bed-rock of the plscer, is clay slate, mingled with talcose slate and hard schistose rocks. Upon the bed are found petrified oak logs, and occasionally bones and teeth of the Mastodon, precisely as such vestiges are in the rich gold drift in Siberia. Mingled with the logs and bones is a concretionary deposit of washed pebbles, containing magnetic iron, sand, olivine and diamonds. This gravel bed is the chief matrix of the gold, which is mainly fonnd in fine particles, but is sometimes met with in the form of lnmps and nuggets. The gravel bed ranges from three feet to ten feet in depth, and is really the true pay dirt. Upon the gravel stratum rests a heavy layer of white quick-sand, mingled with iron oxide and tertiary clay. This sand bed is from 10 to 100 feet in deptb, and although it contains a little fine gold, is comparatively barren. The crown and summit of the entire mass, is a broad sheet of black basalt, columnar in structure, hard as iron, and with a perpendicular thickness of from ten to sixty feet. This basaltic cap makes the uneroded summit which hss formed the tertiary beds into table mountsins. Tbe work which hss been done by the Messrs. Hendricks, at Morris Ravine, and by the

Spring Valley Water Co.

At Cherokee, is simply herculean. It is impossible in a short commnication, to givo anything like an adequate idea of the labor performed, or of the obstacles whicb human energy has overcome. Suffice it now to say that they have brought water through pipes, flumes and ditches for many leagnes, over almostinaccessible mountain fastnesses; that they have demoustrated unheard of facts in hydrostatics and pneumatics; tbat they are now gnawing away both ends of tbe great tertiary bed with six thoussnd inches of water, and are monthly cleaning up hundreds of thousands of dollars in gold.

Towns.

Marysville is a nice old town, but it is too far from the mines, is subject to floods and is too closo to Yuba city. Dogtown bas legendary rich mines and is waiting for something to turn up. Iuskipps ditto. Yuba county has, as a whole, got the dry rot. It is a wealthy old stamping ground, bnt it greatly needs water and enterprize. Sierra county beats the world for variety and extent of mineral deposits, but it lacks outside communication. If your folks at the bay could take even a hasty glimpse at the treasures of

Plumas County,

They would wonder why California street runs wild sometimes, over Nevada wild-cat. Let me tell you what I have seen in Plumas: I have traveled over a ledge of fine Steatite one mile in diameter; and fire-bricks, you know, are worth twenty-five cents apiece at Virginia City. I have examined innumerable quartz ledges which bave never been worked and are so rich in gold that you can mash the quartz and pan out enongb to pay your grub bills. Through tbe entire country runs the great central tertiary gravel lead, extending from Laporte to Spanish Peak, which has always yielded more gold than any other gravel bed in the state. I know of two well defined ledges of Barytes, which is now so much in demand as the hardening element in artificial or Steatitic marble. Plumas can boast of the most extensive iron mine on tbe coast. Sbe also has more copper mines with a richer kind of ore than any county in California. I know of a ledge of black oxide of manganese in Plumas, which is thirty ysrds in width and will yield 80 per cent. oxygen. There are vast beds of marble, common limestone, silver, lead and antimony; a grand water-power for machinery, and timber inexhaustible. Plumas is vastly rich iu the future.

Lassen County

Is mainly adapted to agricnlture and also to cattle and sheep raising. It is easily accessible either from tho Sacramento valley *via* Chico, or by the daily stage line from Reno. From the last named place to Susanville, the route passes tbrough Long Valley, Honey Lake Valley and Susanville Valley. The scenery is picturesque and the road almost a level, all tbe way. For twenty years past, gold has been found in paying quantities aloug Gold Run and other streams in this county, but the extent and richness of its placer gravel beds were not fully understood until within the past two years. That gold existed at Hayden Hill and copper at Big Meadows, has been known for a longer period, but more recently miners discovered that the gravel deposits were not only extensive, but richer than any hitherto known. Something more than a year ago attention was attracted to an euormous gold bearing gravel bed on the very apex of the Sierra Nevada, a few miles south of Susanville. Parties are now engaged in developing this mine and the wonderfully rich prospects whicb they have found encourage the belief tbat their labors will be crowued with success. Infinitely beyond Dismond Mountsin and beyond anything whicb I have seen in this region as a placer deposit, is the

The Susanville Gravel Mine,

Near Big Spring, twelve miles west of Susanville. Recently Mr. Isaac Branham, of San José, purchssed a large interest in this mine and is now actively engaged in cutting a ditch to the works. The mine is a tertiary gravel bed having a visible length of one and a half miles from north to south and a length of one mile from east to west. On the north, west and south the gravel is covered by an outflow of lava as at Cherokee. On the east, the mine is bounded by a rim of solid granite. In brief, the mine is a gold-bearing gravel basin of surprising richness. The Susan river, containing for most of the year, 2,000 inches of water, runs directly through the heart of the bed, and can be easily bronght to bear directly upon the mine by making a ditch, or flume, three miles in length.

The gravel bed bas the remarkable depth of about sixty feet and yields pay-dirt to every panful of gravel from surface to bottom. It is easily washed, and unlike the famous deposits at Cherokee, Morris Ravine and other gravel beds, it is not the least encumbered with heavy strata of sand, clay, boulders and other hindrances, but is very rich pay-gravel from top to bottom. There is a splendid fall for under currents; it is easy of access snd is altogether the best opening for a big investment and rich golden harvest on the Pacific Coast. Tell some rich bugs to go and see it. I leave for Quincy in two days. Yours truly,

W. F. STEWART.

Susanville, Aug. 11, 1873.

MECHANICAL PROGRESS.

Shaping Machinery.

Down to about the year 1830, all operations in wood work that involved irregular lines, were without exception performed by hand. No machines were known, or if known, were not used, previous to the introduction of those built under the patent of Boyd or Blanchard. This patent, although dated 1820, failed for a term of twenty years at least to disseminate any ideas of irregular cutting by machinery, and it would be in fact no exaggeration to say that even at the present time the general principles upon which such machines operate are but imperfectly understood. We of course do not mean to say that such machines are to be properly and intelligently arranged by the builders, but that their operation is popularly appreciated as a kind of mysterious one that does not come within the regular sphere of mechanical laws.

There was in fact such an air of improbability about the cutting out of shoe lasts, gun-stocks, etc., by machines at the beginning, that the impression has not yet passed away. Among those unacquainted with mechanics, and we might include a great share of those who have studied only special branches of mechanics, a machine is always associated in the mind with rotary motion and true curves, or rectilinear motion and straight lines. This is less strange when we consider that aside from economizing human force, the great object of machines, and the distinction between machine and hand manipulation may be explained by saying, that *machines act in true geometrical lines with almost unlimited force and speed.* "Hand operations" *are not guided in true geometrical lines, and are limited in power and speed.*

Hence the machinery for irregular forms, although governed by the same laws, presented the idea of an anomaly to the mind. The mechanism involved also contributes to this impression; it is of a character more complicated than that for straight lines or curves, so much so, indeed, that in some cases the plan of operating is with great difficulty explained to the unskilled.

Shaping machinery, in the sense in which the term is here employed, comprehends turning machines for irregular forms, carving machines, and machines operating in one plane only; such as the moulding tables with right and left spindles, etc. The operation of all these machines can be described in a general way as "working from a pattern," duplicating forms already produced, from which and by which the action of the tools is directed. The part in contact with the model can be termed a guide, between which and the cutting tools, or the blank itself, there is coincident movement. In all the various modifications of machinery for shaping, we find the same mechanical equivalents, although for the better understanding of them they can be divided into two classes; those that adjust or move the tools, and those that adjust or move the material, so as to receive the action of the cutters on its different configurations.

In machines for turning lasts, gun-stocks, spokes for wheels, etc., they are about equally divided between the two arrangements. For carving and the more delicate operations, the tools are adjusted to the forms, or, as is sometimes the case, the adjustment is divided between the material and the center spindles; the one moving in a horizontal plane and the other vertically.

Causes of Boiler Explosions.

The causes of explosions with steam generators are numerous and diversified, but may commonly be traced to carelessness, either in construction or management. Of the former, the most glaring is that shown in boilers so made that no provision exists for the uniform expansion and contraction of the parts from changes of temperature. This causes a slow weakening at one place or another, which is sure to give way at one time or another when the usual steam pressure is exceeded. The continual boiling of water is likely to expel all the air therefrom, in the event of which it will remain quiescent up to a temperature as high as two hundred degrees Fahrenheit, when it suddenly flashes into steam. Some writers, Tyndall amongst them, aver the possibility of disastrous explosions from this cause. Experiments made on a small scale with special apparatus seem to show that a film of oil on the interior of the boiler may sometimes produce a like result. On the other hand, the grease used in lubricating engine cylinders, frequently finds its way into the boilers, and few or no authenticated cases of misbief from this source are on record. The idea sometimes advanced that the grease decomposed into explosive gases that produce casualty is nonsense, because the known volume of such gases even if produced would be insufficient to produce such a result. Sometimes an accident, slight itself, brings death and disaster long after, as was the case with the boiler of the steamboat St. John, seven or eight years ago, in which the corner of the cold chisel used in levelling a plate grooved the one below it and led to the parting of the iron as soon as a high pressure, otherwise perfectly safe, was reached.

A LARGE mass of meteoric iron has been found in Saxony, containing 5.31 per cent. of nickel.

The Grandest Bridge Ever Planned.

One of the greatest engineering feats ever projected, is the construction of the great bridge which is to span the Hudson, at Poughkeepsie, about half way between New York city and Albany. This structure, says the Poughkeepsie *Eagle*, will consist of five spans, of 500 ft. each, at an elevation of 196 ft. above the river! A bridge has never before been constructed of five spans of 500 ft. each, but the engineers say "it is only a matter of calculation and money." To give sufficient strength to these spans, the iron work will require to be 64 ft. in hight, and this will give a total hight from the water to the top of the bridge of 194 ft.

It is proposed to run the railroad-track on the top cord of the bridge, so our readers can imagine themselves crossing the river on this magnificent structure 200 ft. above the water. To raise the immense spans of 500 ft. to their places will require the construction of an entirely independent wooden bridge from shore to shore. This wooden bridge alone, built to be immediately removed after the spans are in their place, is estimated by Mr. Lindville, the chief engineer to cost $400,000. This gives but a faint idea of the magnitude of the great work.

Detailed plans for the structure of the bridge have not yet been made, but it will be what is known as the "Lindville Truss," a modification of the ordinary iron truss, having certain peculiarities of bracing, fastenings, etc., invented by Mr. Lindville, from whom it takes its name. This gentleman, who is one of the first, if not at the head of the bridge engineers of this country, will make the Poughkeepsie Bridge his especial care, as he considers it the grandest structure of the kind ever projected, and when completed it will be a masterpiece—one of the wonders of the world.

MORE EXPERIMENTS ON BOILER EXPLOSIONS.—No doubt every one interested in the matter will hear with satisfaction that the United States government has appropriated another $100,000, to be expended in investigations and experiments on the cause of steam-boiler explosions, of a similar kind as were last year so successfully performed at Sandy Hook under direction of Col. Stephens. The Franklin Institute of Philadelphia is charged with the supervision of this important work, which this time will not only be made at Sandy Hook, but also in Pittsburgh and Cincinnati, each under the charge of a committee of five engineers. No investigation, as well in regard to the establishment or refutal of scientific theories, as in its consequences to the safety of life and property, has ever been more worthy of governmental aid, and we hope that it will at last dispose of the fallacies which are still adhered to by many, and establish in an all-convincing way the knowledge of the true causes of those so melancholy and too common accidents—boiler explosions.—*Builder.*

PROGRESS IN LOCOMOTIVE CONSTRUCTION.—AMERICAN LOCOMOTIVES.—The demand for American machinery in foreign countries increases with every year, and the extensive exportations of steam engines to Russia, Austria, and other countries, furnishes ample evidence of the real merit of American mechanism. Upon this topic the *London Engineer* says: "It is beyond question—be the cause what it may—that the locomotive engines used in the United States cost less money and do more work than English locomotives." The successful trial of some American locomotives on one of the Russian railways has recently called forth a glowing acknowledgement of their superiority, in the journals of that country. Such facts are worthy of careful consideration by those who fear that other fields of trade in articles of manufacture are too completely in other hands to permit of competition on the part of American manufacturers.

AN IRON CHALLENGE.—Our spirited contemporary, the *Ironton Journal*, throws down its iron-ribbed gauntlet to the whole world in the following words: "Who can beat it? We have been shown a piece of common iron, the product of the mill of the iron and steel company (formerly the Ironton Rolling Mill), which had stood a tensile strain on their Riehle tester of 90,000 lbs. to the square inch. In last November, we witnessed a test of their iron, which parted under a strain of 81,495 lbs., and this was regarded as most extraordinary, the best test made before that by Mr. Yatman, who put up the testing machine, having been 79,090 lbs. The test now spoken of confirms us in the statement we made last fall that the Hanging Rock iron is the best in the world."

THE OCEAN TIDES SET TO WORK.—One of the first results in the rise in the price of coal has been the formation of a company in France, supported by plenty of capital, whose object is to utilize the power of the ocean tides on the French coast by proper machinery. The first experiment will be made at St. Malo, where the tide rises nearly eighty feet and overflows many square miles of flats.

RAILROADS IN RUSSIA.—It is stated that the Russian government is at present occupied with the consideration of the new network of lines which will embrace fourteen railways, having a total development of 4,000 versts (about 2,600 English miles.) These roads are to form part of a system of railway communication for military purposes.

Improved Hose.

The New England Linen Hose Manufacturing Company produces hose without a seam, making it strong from the start; a rubber lining adding, if possible, to its strength. It has been tested by the Boston Fire Department under a pressure of 230 pounds to the square inch, while several heavily loaded teams passed repeatedly over it. The Lawrence Fire Department carried the pressure to 268 pounds without bursting or sweating. A perfectly water-tight hose can, without fear of damage by water, be carried through private dwellings or warehouses; and this quality of imperviousness is a strong recommendation. Its light weight is another important item, a section of 50 feet of this hose, with couplings attached, weighing on an average 32 pounds. Rubber or leather hose weighs more than double. In consequence of its light weight it is therefore especially adapted for carrying to upper stories and roofs of houses, and much of the danger to firemen by breaking of ladders is avoided, as one man can with ease carry 100 feet. One hose-carriage can also carry 1,500 feet, and only about 600 feet of the heavier kind. The office of the company is at 179 Washington street, Boston.

COLORED TILES are being extensively manufactured in Pittsburg for flooring purposes. There are many advantages in using tiles in this way; they lead to neatness, coolness in Summer, and greater architectural beauty.

SCIENTIFIC PROGRESS.

The Velocity of Light.

Recently M. Fizeau has communicated to *Les Mondes* the results of a series of very elaborate experiments made with a view to the most accurate determination of the velocity of light. The distance between the two stations of observation, as found by triangulation, was 33,828.1 feet (about six miles,) with a probable error of 0.001. The source of the ray was a jet of oxyhydric gas. Six hundred and fifty satisfactory observations were made, the mean of which gave 185,368 miles per second as the required velocity. The experiments of M. Foucault to determine this same velocity give us a result of 185,178 miles.

The formerly accepted determination of the velocity of light was that of Olaf Roemer, a Danish Astronomer, who deducted it from observations on Jupiter's satellites. The earth's orbit being concentric with that of Jupiter, and interior to it, the distance of these bodies is continually varying, the variations extending from the sum to the difference of the radii of the two orbits, making the excess of the greatest over the least distance equal to the diameter of the earth's orbit. A comparison of the eclipse of Jupiter's satellites during many successive years showed that those which took place about opposition were observed earlier, and those about conjunction later than an average or mean time of occurrence. Connecting the observed acceleration in the one case, and retardation in the other, with the variation of Jupiter's distance below and above its average value, the difference was fully and accurately accounted for by allowing 16m, 26s. 6 for light to traverse the diameter of the earth's orbit. From these data Roemer found the velocity of light to be about 192,000 miles per second.

It seems at first sight as if the recent and very accurate determination of Mr. Fizeau had demonstrated a defect in the earlier method, indicating, perhaps, some cause, connected with the acceleration and retardation of the apparent occulations of Jupiter's satellites, other than the time required for light to traverse the earth's orbit. But Capt. C. W. Raymond, U. S. Engineers, at present Assistant Professor of Physics at West Point, calls attention to the curious fact that by substituting in Roemer's calculation a more accurate value of the diameter of the earth's orbit, the resultant measure of the velocity of light becomes 185,344 miles per second, which agrees astonishingly with the figures of M. Fizeau. Similar experiments conducted some time ago by M. Foucault indicated 185,177 miles per second as the velocity. This one of the question which will be affected by the thorough observations, to be made by trained astronomers of all nations, of the next transit of Venus. The diameter of the earth's orbit, which may be called our astronomical unit of distance, will be probably finally determined by those observations.—*Engineering and Mining Journal.*

IT is not, perhaps, generally known that the cause of the cutting properties of several species of grasses, which will cut the hand when drawn across it from the tip down, is the presence of silica, which has crystallized out in much the same manner as the sugar of the sugar cane and other vegetables.

OZONE has been successfully applied as a reagent in chemical research. It is recommended as an oxidiser, to take the place of the common reagents, sulphuric acid, bichromate of potassa, chromic acid, etc., especially in analysis of organic substances.

Agassiz on Darwinism.

Professor Agassiz, in the last lecture of his recent course at the Museum of Comparative Zoölogy, in Cambridge, gave his views on the Darwinian theory with more plainness than ever before. He contended that the fact of a resemblance, in certain stages of growth, between different species, is no proof that one has been developed out of another. On this point he speaks as follows:

"We see that fishes are lowest, that reptiles are higher, that birds have a superior organization to both, and that mammals, with man at their head, are highest. The phases of development which a quadruped undergoes, in his embryonic growth, recall this gradation. He has a fish-like, a reptile like stage before he shows unmistakable mammal-like features. We do not on this account suppose a quadruped grows out of a fish in our time, for this simple reason, that we live among quadrupeds and fishes, and we know that no such thing takes place. But resemblances of the same kind, separated by geological ages, allow play for the imagination, and for inference unchecked by observation."

Professor Agassiz maintains that there is no unvarying, inevitable evolution in the geological succession of organic life. "It has," he says, "just the freedom of manifestation, that independence, which characterizes the work of mind as compared with the work of law." Instead of everything having gone forward mechanically, as the evolutionists claim, the animals that should be ancestors, if simplicity of structure is to characterize the first-born, are known to be of later origin; the more complicated forms have frequently appeared first, and the simpler ones later, and this in hundreds of instances. But here again we cannot do better than to allow the Professor to state his conclusion for himself:

"I believe that all these correspondences between the different aspects of animal life are the manifestations of mind acting concionsly with intention toward one object from begining to end. This view is in accordance with the working of our minds; it is an instinctive recognition of a mental power with which our own is akin, manifesting itself in nature. For this reason more than any other, perhaps, do I hold that this world of ours is not the result of the action of unconscious organic forces, but the work of an intelligent, conscious power."

This able and earnest protest against Darwinism, like the remarkable article on the subject that has recently appeared in the *Quarterly Review*, will command the attention of the whole scientific world. It is hardly possible that these vigorous attacks will be endured in silence by Darwin and his followers. We anticipate some lively fighting between the opposing parties.—*Boston Jour. Chemistry.*

ACCORDING to *Harper's Weekly*, the United States Signal Corps has recently extended its series of observations to include a daily record of the surface and bottom temperature of the rivers and harbors on which its several stations are situated. These observations are not only of interest in a meteorological point of view, but as they are also of great practical importance in connection with the introduction of useful food-fishes into the rivers and lakes of the United States, a work which is now being energetically pushed forward under the supervision of Professor Baird, the United States Commissioner.

It is well known that the possibility of introducing salmon into any given stream will depend upon the relationship of its temperature during the summer and autumn to the particular species; some kinds, as the true salmon of the North Atlantic (*Salmo salar*), requiring a summer minimum of at least sixty to sixty-five degrees, while others will bear a higher temperature.

The Signal Office has also recently established the regular publication of a weekly weather-chronicle, which will doubtless prove of great interest to meteorologists.

ANTIMONY is used principally as an ingredient in various alloys. There are two type-metals; one is composed of tea lead 75 parts, antimony 20 parts and block tin 5 parts, and the other of tea lead 70 parts, antimony 25 parts and block tin 5 parts. 133 pounds of stereotype metal are made up as follows: Lead 112 lbs., antimony 18 lbs. and tin 3 lbs. Britannia metal is composed of 90 parts of tin to 10 of antimony, though sometimes a different proportion is used. Antimony is also used in the manufacture of concave mirrors, to give them a finer texture and higher lustre, and in bell castings, to give a clearer and stronger sound, as well as to make them whiter and harder.

SUBSTITUTES FOR BONE CHARCOAL.—Several substances are used to take the place of bone black, none of which, however, have been found to act as well in decolorizing and clarifying. Among them are a peculiar kind of bituminous shale, carbon obtained by charring molasses, and peat charcoal.

COLORED ENAMELS are made by the fusion of certain metallic oxides. Purple enamel is produced by oxide of gold, blue by oxide of cobalt, black by binoxide of manganese, violet by the latter substance in less quantity, green by oxide of chromium, red and yellow by mixtures of various oxides.

Weekly Variations in Stocks.

[Based on Regular Sales of all Stocks in the San Francisco Stock and Exchange Board.]

For 6 days ending Wednesday, Aug. 20, 1873.

Our Weekly Stock Review.

THURSDAY EVE., Aug 21, 1873.

Stocks are down and politics are up. The movements in the Stock Market are of no interest to anybody while the movements in political circles absorb the attention of a large majority of the community. The past week has brought no change in the aspect of the Stock Market, and it continues dull and weak. Prices have shown no remarkable fluctuations, and the amount of business done has been small. Monday was an exceptional day in respect : Stocks which have of late been down, went up a little; and the contrary is usually the case on that day of the week. The following day, however, the advance was lost again and the market resumed its inactive tone.

California Stocks are very little operated in, which is no doubt a subject of congratulation. Most of the California mines are being worked by private parties or corporations who don't want to sell any stock. In this connection the *Post* makes some pertinent remarks. It says: To be sure, there are many good mines which are paying dividends, but they are not known among the California street Arabs, and therefore are not appreciated because they are not quoted as salable and speculative in the Stock Board by the daily press, or talked about upon every street corner. There is Eureka (Grass Valley), which at one time was held firm because it paid about two per cent. per month, but that was when the Comstock was supposed to be "played out," and such mines as the Crown Point and Belcher were not dreamed of. Now, it pays five per cent., and does not fluctuate enough in price to pay for the feed of a church mouse. So, taking the California stocks sold in Board, the they don't draw the attention of outsiders any more than Original Hidden Treasure in White Pine. In fact, speaking of a market, they are left out in the cold. The Ely Stocks are also getting narrowed down so much, that, for a regular thing, there are only three or four gambled in extensively.

The low state of the water in the Carson river checks hullion production, although the Comstock mines are turning out about the usual quantity of ore. The only advances in stocks over last week's prices are about as follows: Buckeye, 75 cents; Caledonia, $2; Chollar, $1.50; Belmont, $2 25; Bowery, $2 25; Empire, $3 25; The other advances are slight and the declines also,

SEVERAL thousand miners in Leicestershire, in England, having struck in consequence of dissatisfaction with the weighing system, many of the coal pits have been closed.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

AMADOR COUNTY.

GOOD HOPE MINE.—Amador *Ledger*, August 13 : Mr. Charles Peters left at this office several pieces of quartz rock, taken from the above-named mine, all of which are well filled with free gold, visible to the naked eye, and certainly give evidence encouraging to the owners. Our readers are aware that the Good Hope adjoins the town tract on the south, and is undoubtedly a continuation of the great mother lode of this belt. From the very flattering indications so far developed in prospecting the mine, it should by all means command sufficient capital to fully prove its worth. Should this be obtained, there is every probability the Good Hops will prove to be as valuable a mine as any in the Co.

STATE OF MAINE MINE.—Amador *Ledger*, August 16: We are pleased to learn that work has been resumed upon the above named mine, and is now being vigorously prosecuted, and that it is the intention of the owners to thoroughly develop the mine. Since the resumption of labor, we learn the mine presents a very flattering appearance. We have seen very rich rock taken from the State of Maine mine, and from our knowledge of the veins of this mineral belt, we entertain no doubt, but, when the above mine shall be fully developed, it will prove to be one of the really valuable mines of the county. We are pleased to know that the owners are determined to push forward its development.

KERN COUNTY.

CLARA BELLE DE BILK. — Havilah *Miner*, August 9: MESSRS. Carson & Webb have sold out their splendid little lead for the insignificant sum of $1,000 to Blake & Milton. We are of opinion that the boys have let a good thing, although a "bilk," go too cheaply. They have made many "runs" on rock, and they are making one now on the proceeds of the sale of the mine. We hope they will enjoy themselves on this last run.

THE CAPE HATTERAS MINING CO. have bought steam-hoisting works, and are busily engaged putting them up. A large force of men are employed.

THE MAMMOTH TUNNEL is now in 180 ft. A blind ledge, 15 in. thick, was struck 3 days since, and gives a good prospect.

RICH ROCK.—Mr. Joe Hudnut arrived in town last Monday, from the Claraville district, where he has been working several months, running a tunnel to a new lead, which he calls the Bella Union. He struck the ledge and brought some of the average ore to town. He prospected about 2 oz., and found a dollar in dust in the horn spoon. Pretty good for average.

JOE WALKER MINE.—Over 100 men will be required at this mine as soon as the water is pumped out. As we go to press we learn that the pump has been lowered several feet. A large quantity of high grade ore is being extracted from this mine.

PANAMENT DISTRICT.—Havilah *Miner*, Aug. 16: The new district of Panament is situated in what is known as the Telescope range of mountains in the southeastern part of Inyo county, about 130 miles northeast of Havilah by the route traveled. It is represented by experts, who have visited it for speculative purposes, as being one of the very richest and prolific districts on the Pacific Slope, in silver ores. These mines were first discovered last Fall, but no extensive explorations of the district were made.

In the spring of this year prospecting was again resumed, and as a result some 100 silver lodes have been discovered and located, which for body and richness stand, at least in the State of California, unrivalled—the lodes running from 2 to 30 ft in width, and assaying from $200 to $1200 per ton of ore. Principal among these mines are: The Wonder of the World, Challenge, King of Kawit, Little Chief, Esperanza, Marvel, Garry Owen, Woodpecker, Sunnyside, Wide West Canon, Peuos, Atlas, Canadian, Stonewall Jackson and Robert E. Lee.

We have seen and conversed with many persons who have visited these mines, and without an exception they speak in glowing terms of the wealth of the Panament

District, and whilst we are disposed to make all due allowance for the excitability and exageration of the California mining prospectors, we have no doubt this district is all that has been claimed for it, and is sure to be one of the wealthiest and most noted mining districts of our State.

PIUTE.—Mr. Henry Babten was in town this week. Everything at the Bright Star is developing encouragingly. Additional stamps will soon be set. The yield is so regular in this mine, we believe that the proprietors could now tell their yield for next December.

ACTIVE PROSPECTING.—This week has been one of unusual activity among our amateur miners. Some of them have brought in good finds, and knowing it they are as silent on the compass as though they had never heard of such an instrument.

BELLA UNION MINE.—This mine was this week furnished additional working force. Joe Hudnut is superintending the works. Ten tons now on the dump with $100 per ton.

ROCK brought in from the Grizzly this week encourages the owners, and high hopes are entertained of its developing into another of our big finds.

BIG BUCK.—We are informed the contract has been let and work commenced on an immense shaft on the Big Bina at Kernville. The hole is being made just back of the town.

PLUMAS COUNTY.

THE PLUMAS EUREKA.—Plumas *National*, August 16: This mine is again doing well, though running only 30 stamps. The Superintendent who came up from Sutter Creek, and remained a few weeks, shut down work in all the different chimneys except the big one discovered 4 years ago, and of known rich quality; since then the mill has been doing well for the number of stamps at work, but as soon as a donkey engine can be brought up and put in place the mill will run to its full capacity, in the meantime the lower levels will be pushed forward as fast as three eight-hand shifts can run them, and by early winter the chimney will be tapped a great deal lower, giving backs for several years milling. Another Superintendent is expected to arrive on the next stage. The outside improvements now going on are bulkheads and fillings on the upper side of the mill, to prevent the bank from sliding, and the erection of a building to be used for offices and storehouse. They are also building a mammoth woodpile on the lee side of the mill, upon which they expect to place three thousand cords, or amply sufficient to run them a year, even if the supply of water should be as limited as that of the present season.

TUOLUMNE COUNTY.

THE SHAWMUT.—Union *Democrat*, Aug. 16: There was a breakdown in the machinery of the mill at this mine a few days ago. It is in order again and crushing ore. There is a force of 22 men employed at this mine.

We learn that Elias Dunaway and C. O. Dresher have opened a vein of quartz near Algerine that promises to be rich. It is from 6 to 18 inches in thickness, and shows free gold throughout.

TUOLUMNE *Independent*, Aug. 16:—The mines here are pushed with might and main, day and night. On Saturday, the men working in the tunnel in the Funk mine struck their vein at a distance of some 300 ft. from starting. Every effort is going to be made by Mr. Funk to have quartz enough out to start his stamps to crushing next month. Good luck, we say to the Hidden Treasure Mine.

HILL & MARSHALL MINE.—The tunnel is on the last 100 ft., and they are making the most strenuous efforts to have it soon finished, which no doubt they will accomplish when they have assistance of first-class miners like Wm. Logan Esq. This mine hitherto has proved to be very rich, running as high as sixty dollars per ion, for weeks at a time.

POWLES, SMITH & GRAY are getting both their mines in easy condition to get ore, and sometime next month will be ready to have their arastras running. Their rock in both veins is said to be first-class. Mr. Gray, one of the firm, is going to spend a few weeks among the mountains, up above here, to rest him up, preparatory for the winter's work ahead.

THE PATTERSON is yielding ore abundantly, which is mined and milled at a low figure—a few hands being only required to keep the batteries flooded, and it is said at present that it is only a question of stamps which keeps it from being placed at the head of the list of the paying mines upon this Coast.

AN IMPORTANT DISCOVERY.—Stockton *Independent*: While in Tuolumne county, a few days ago, we were shown specimens of ore taken from the claim of Messrs. Tullock, Knowles and others, located near the summit of the Sierras in Tuolumne county. While we do not pretend to be expert in silver ores, we are satisfied that these gentlemen have a valuable mine, and that rich developments will soon be made in that locality. We learn from the Tuolumne *Independent* that rock from this claim, taken only 12 ft. from the surface, assays at the rate of $208 per ton in silver. The discovery of such rich silver mines on this side of the Sierras will materially aid the development of Tuolumne county, and anything that benefits that county will also benefit San Joaquin. We hope that the favorable reports from this newly discovered mining district may be confirmed, and that these enterprising prospectors may be richly remunerated for their labor. The rock now being taken from this mine is sufficiently rich to warrant the erection of a mill, and, as we are informed that the lead is extensive, there is a probability that this district may soon be one of the most important mining localities on the Coast.

Nevada.

BRISTOL DISTRICT.

SULTAN.—No particular change to note in the Sultan mine this week. The vein maintains its size, and the ore its average richness. Taking out the usual amount of ore in sinking.

CAVE.—The winze is now down 22 ft., following the seam in the limestone. It has now widened out considerably, showing a width of 2½ ft. of decomposed vein matter, and 6 ins. deeply stained with mineral, showing the close proximity of ore. The tunnel is in 25 ft., having yet 75 to run to make the connection with the winze. Taking out from 10 to 15 tons daily from the old workings.

HIGHLAND.—Ploche *Record*, Aug. 3: The Hamburgh ledge at the bottom of the shaft is fully 2 ft. wide; all paying ore. The tunnel, which is being run to tap the vein, will cut the ledge, some time this week, at a depth of 300 ft. from the surface.

CHAPMAN.—The indications on the 430-ft. level are improving very much.

LOUISE.—Nothing of public interest has transpired since last week.

MAZEPPA.—Sinking on the main shaft with the usual force.

CORNUCOPIA DISTRICT.

NO EXAGERATION.—Ploche *Record*, August 13: Quite a number of persons who made a flying trip to the new mines from this place, to satisfy themselves as to the correctness of the reports from that point, have returned, and all with whom we have conversed express themselves without hesitation as being convinced that neither the value of the strike nor the general character of the country has been in the slightest degree exaggerated, and they are now making preparations to return for a prolonged stay.

SPECIMENS.—We were shown specimens of ore from several new locations that were good enough to satisfy any reasonable man. Mr. Roulstone, of Railroad District, brought with him samples of ore for assay, from other new locations, and judging from appearances we shall be much mistaken if they do not run high in the precious metals.

The ledges from which these samples were taken are large and well defined.

ANOTHER LOCATION.—We learned on yesterday morning from a resident of this place that five days ago he in conjuncture with four other persons located a gold-bearing ledge 20 miles south of Cornucopia in the same range. A shaft 5 ft. square has been sunk near the hanging wall, which is well-defined, showing a clay seam, but the lower wall has not yet been reached. At a depth of 5 ft., the rock is said to have prospected well in free gold. Samples of the ore have been sent to Virginia for assay. So soon as returns are made particulars will be given.

Only a few days prior to the new strike we visited some mines situated 8 miles south of the diggings, and found one of the prettiest locations we have ever seen in the State. A tunnel, 50 ft. in length, was run upon the ledge, showing a vein 5 ft. wide, between 2 smooth walls, clay seams, from which issued a stream of water 3 inches in volume. The casings are of granite, and the assays showed $15 in gold and $32.50 in silver. We also found float 6 miles south of these locations, but could not spare the time to do any prospecting.

CORNUCOPIA.—Virginia Evening *Chronicle*, August 13: Reports from the Elko mines continue favorable. At the depth of 12 ft., the character of the rock is similar to that on the surface. Experienced miners express the opinion that a true ledge has been discovered. Prospectors are engaged through the surrounding hills, and some are engaged in jumping each others claims. Several tunnel sites have been located, and another town site surveyed. Many buildings are on the way from the line of the railroad to be put up in the new district.

LEOPARD AND CHLORIDE.—Territorial *Enterprise*, Aug. 16: We yesterday saw in the hands of Mose Hayhes, of Elko, two very fine specimens of ore from the Chloride and Leopard, two of the principle leads in the new and much-lauded Cornucopia District. That the samples shown are immensely rich can be seen by any one who is a judge of ores, without waiting for the test of an assayer. From samples of ore from the Chloride lode some very high assays have been obtained. An assay made by Conrad Wiegand, of this city, yielded at the rate of $17,000 to the ton. A sample of ore from the Leopard showed $400 in silver and $100 in gold. We like the appearance of the ore from the last-named lead much better than that from the Chloride.

The rock has a better grain and a more free and "healthy" look. The piece of Leopard ore shown us, rich as it is, had evidently been broken from the top of the ledge, as it presented that worn and weather-beaten look which no one familiar with ores can easily mistake.

ELY DISTRICT.

AMERICAN FLAG.—Ploche *Record*, Aug. 10: The mine looks unusually well throughout, all the stopes showing a marked improvement. Working the usual force. During the past week no connection has been made by pipe between the mine and the upper water tank, thereby securing an abundant supply of water for all purposes, and rendering the works doubly secure in case of fire. The company's mill is running temporarily on ore from the Newark mine, and, as usual, is giving a good account of itself.

MONTANA.—The drift in the 173-ft. level is being pushed steadily onward. The dip of the country rock, which has hitherto been towards the valley, has turned, and is now dipping into the mountain, in this respect following the dip of all the principal mines in the district. The vein was very large and strong on the 100-ft. level, and when it is reached in the lower level, we look for something pretty good.

PONTLAND.—For the last day or two have not been taking out the usual amount of ore, in consequence of some timbering done at a point which impeded the work of extraction. The main shaft is being rapidly sunk by contract. The ore in the drifts and stopes, from the 200-ft. level upwards, never looked better.

SPRING MOUNTAIN TUNNEL. — No new developments to report since last week. The work of sinking on No. 3 ledge still continues with improved prospects with every foot made. The ground is also improving in other respects, as it is gradually getting softer and showing the near presence of mineral and a larger vein body.

ALPS.—Working 21 men, and hoisting about 5 tons of ore daily. The Amador mill is now running on ore from the Alps. About 240 tons are to be crushed, and the bullion returns may be looked for about the 15th inst. The ore is of a high grade. The winze on the 154-ft. level is down 45 ft., in ore which assays well.

INGOMAR.—The main shaft is now 575 ft. deep, and a drift has been run on the vein at that depth for a distance of 220 ft., showing a large and strong vein of excellent ore. For the past month the production of the mine has averaged fully 3 tons of ore per day. Working a full force of men.

PAGE AND PANACA.—Sinking a winze in the vein from the 360-ft. level. Have now reached a depth of 90 ft. The ground is improving in character for working, and shows more favorable indications. The greatest drawback is the presence of water in the winze, which causes much delay. The bottom of the winze is now dry, all the water coming in from above. Working twelve men.

MEADOW VALLEY.—There is no change to note in this mine at present. Work is just now suspended in No. 5, on account of accident to the machinery, which is referred to in another column. It will be resumed, however, in about five days.

PIOCHE-PHENIX.—Drifting to the west at a depth of 500 ft., and it is expected that the ledge will soon be reached. The miners will begin taking out ore as soon as they cut the ledge.

SILVER PEAK.—Twenty-five men were put to work on this mine on Monday last. The new machinery spoken of in our last review, works to the entire satisfaction of the owners. The shaft has been continued 10 feet, and 15 tons of first-class ore have been taken out. They expect to commence hauling ore to the mill to-morrow.

HAVANA.—Day before yesterday the east drift was started on the vein, at the 250-ft. level. The face of the drift is all in ore, of a very high grade. It is the intention to erect hoisting works as soon as practicable.

PIOCHE.—There are now on the dump 50 tons of ore. The assay of the car sample of Aug. 9, was $207.24. This ore when milled will therefore yield about $140 per ton. The new shaft is completed to the depth of 175 ft. It is calculated that the ledge will be struck at a depth of 900 ft.

CAROLINE.—The machinery for new hoisting works is now all on the ground. The work of putting it together was commenced yesterday, and it is expected to be finished in 8 or 10 days' time. As soon as this is finished 15 men will be put to work.

CHIEF OF THE HILL.—The sinking on the main shaft has been continued 12 ft., and a progress of 20 ft. has been made in the west drift at the 210-ft. level. A small quantity of ore is taken out daily.

WASHINGTON AND CREOLE. In the west drift, in which no ore had been previously found for some time, a ledge of first-class ore, one and a half feet wide has been struck.

SUMNER.—Work on the contract for sinking the shaft is progressing steadily, and the vein shows a marked improvement in size and quality.

RAYMOND & ELY.—Last week work was resumed with 160 men. There is no change in the character of the ore, 75 tons of which are taken out daily. Shipping ore commenced on Friday.

BOWERY.—Sinking the main shaft, and taking out the usual amount of ore.

PEAVINE.—The new shaft is down 45 ft.

VULTURE.—Work is being pushed ahead as fast as possible, with no material change to note.

BROOKLYN.—The vein in the winze looks better than ever.

MERIDIAN.— Sinking is steadily continued on this mine, with the most flattering results.

CHIEF EAST EXTENSION.—Stoping $225 ore from the 225-ft. level.

SOUTH SIDE.—Will put another shift to-morrow, so that the sinking will go on at the rate of 2 ft. a day.

ORIGINAL DEXTER.—Work is suspended for the present. A whim to be put up soon.

SPRING MOUNT.—DOWN 430 ft. One ledge 3 ft. wide, but hardly rich enough to pay, has been run through.

ALADDIN.—Nothing of interest about the mine this week.

WASHOE.

CROWN POINT.—Gold Hill *News*, Aug. 16: The main south drift, on the 1500-ft. level, is being pushed vigorously ahead, with strong indications of soon reaching the ledge. The main south drift on the 1400-ft. level is again being driven energetically ahead. The flow of water from the two east cross-cuts on this level is all the pumps can manage, but is being drained in such a manner that the supply can be increased or decreased at pleasure. The ore-breasts on the 1200-ft. level are looking and yielding splendidly. The ore-breasts on the 1000 and and 1100-ft. levels are looking and yielding finely. Daily yield 350 tons of ore, which can be greatly increased whenever the capacity of the mills on the river, which is greatly decreased by the extreme low water, are again able to crush their full amount of ore. The north winze, from the 1300-ft. to the 1400-ft levels, is down 36 ft; still in good ore. The middle winze, on the same level, is down 32 ft., the bottom in excellent ore.

BELCHER.—The incline is down 47 ft. below the 1300-ft. level, the rock in the bottom working finely, and excellent progress is being made. The main south drift on the 1300-ft. level is still driven vigorously ahead, the face in excellent ore. The winze from the 1300 to the 1400-ft. level is down 33 ft. the bottom in rich ore. Daily yield 450 tons, which amount can be greatly increased whenever it is the wish of the company to do so. The ore breasts throughout the mine are looking remarkably well, in fact never better than at the present time.

CONSOLIDATED VIRGINIA.—The erection of the new hoisting and pumping machinery is nearly completed; everything so far as tried is working with the utmost perfection. Excavating for the tank pits at the 250, 500 and 750-ft. levels is making excellent progress. The flow of water from the main north drift at the 1167-ft. level from the Gould & Curry shaft continues unabated, an attempt during the week to run a side drift around the break in the main drift proving a perfect failure, the flow of water soon putting a stop to the work.

GOULD & CURRY.—The main north drain on the 1500-ft. level is still driven ahead, with no change of interest during the week. The east cross-cut from the main south drift on the 1600-ft. level has developed a considerable body of low grade ore, with excellent prospects of a gradual increase in the value of the ore as the development progresses. Daily yield 20 tons of ore from the old upper working. Prospecting in the other portions of the mine continues without change of interest.

SAVAGE.—Sinking the incline is progressing at the rate of 4 ft., per day, the rock in the bottom blasting and blocking out splendidly. The east and west crosscents from the main south drift on the 1700 ft. level have developed nothing of value during the week. Crosscuts both east and west have been started on the main north drift on the 1600 ft. level, but have discovered no bodies of ore in that part of the mine as yet. The prospects are yet good for finding ore in both these levels, as they still have large bodies of virgin ground entirely unprospected, and which it will yet take months to explore.

ARIZONA AND UTAH —The shaft is down 360 ft., the sinking progressing at the rate of three ft. per day. The pump continues to handle the supply of water with perfect ease. The incline raise from the main east drift at the 250-ft. level will make connection with the main shaft to-day. The track and cars all being prepared and in readiness, sinking the incline can be at once resumed, the work being greatly facilitated by hoisting directly through the main shaft.

BALTIMORE CONSOLIDATED.—The flow of water is again completely under control, and the shaft sufficiently drained to admit of the resumption of work in the drifts on the lower level. Clearing out and preparing for work in the face of the drifts at the second station will be commenced on Monday next. The face of the south drift at the first station running toward the American Flat line is in good ore.

SILVER HILL.—Sinking the main shaft was resumed the first of the week, good progress being made. During the week, while cutting out the shaft for a set of timbers, a considerable body of water was tapped, for a while greatly impeding the work, but which the pump now handles with ease, and will no doubt be entirely drained in a few days. The northwest prospecting drift at the second station has developed nothing new during the week. The ore breasts in the north drift at the first station are holding out and looking splendidly. Daily yield 50 tons of ore, keeping the Bacon mill steadily running.

OVERMAN.—Sinking the shaft has been resumed, and is making steady progress. The main west drift is still driven ahead, without change of interest. The face of the northwest drift shows considerable quartz, with some water coming in, but not enough to interfere with the progress of the work. The southwest prospecting drift has developed nothing of value during the week.

EMPIRE.—The cross-cuts are still being energetically driven to the eastward on the 1,700-ft. level without change of value. The up-raise from the 1,600 to the 1,500-ft. level is being pushed with all the vigor possible so as to make the connection and give a much needed circulation of pure air, which will greatly facilitate the prospecting on that level.

KNICKERBOCKER.—The blower and other necessary machinery for supplying the mine with air is completed. The southwest cross-cut from the main west drift on the 400-ft. level is being driven rapidly ahead, without material change of interest for the week. Work has been resumed in the face of the main west tunnel on the 400-ft. level.

AMERICAN FLAT.—Work will be resumed in the south drift from the west tunnel, 450-ft. level of the Baltimore shaft, on Monday next.

JUSTICE.—The east cross-cut from the main south drift on the 400-ft. level, is still pressed vigorously ahead, with no developments of importance for the week. The main north drift from the 300-ft. level of the Waller Defeat shaft shows some excellent indications of good ore developments. The main south drift on the same level is making good progress, with no material change of interest to report.

CROWN POINT RAVINE.—The southwest drift from the main west tunnel on the 250-ft. level, is in 45 ft., having cut during the week a fine body of quartz, assays of which give from $3 to $10 in gold and silver to the ton, gold appearing to predominate. The north drift from the main west tunnel, on the same level, is in 20 ft., the face in a mixture of clay, quartz and broken porphyry.

UTAH.—The new pumping machinery is nearly completed and sinking the shaft will be resumed in a very short time. Much trouble has been experienced in getting the necessary castings from the foundry, it being so crowded with work as to greatly delay the fulfilling of contracts.

OCCIDENTAL.—Daily yield, 40 tons of ore. The lower tunnel is being extended along the west casing of the ledge to the northward. The ore breasts are both looking and yielding finely. The mill is kept steadily running on ore from the mine.

CHOLLAR-POTOSI.—Daily yield, 155 tons of ore, the assay value of which is $31 per ton. The ore breasts are all looking finely, and the daily yield of ore is steadily on the increase. There is nothing new to report of the prospecting operations on the lower levels.

TYLER.—The new pumping machinery is all in place and works finely. Everything will be in readiness and draining the shaft commended by Monday next. This will probably take three or four days, and, as soon as it is accomplished, sinking the shaft will be resumed.

DANEY.—The erection of the new hoisting and pumping machinery is making rapid progress, and there is but little doubt that everything will be in readiness to resume sinking the shaft by the 15th of next month.

OPHIR.—Sinking the shaft is making fair progress, though the rock in the bottom is quite tough and hard to hiast. Prospecting the different levels continues as usual, with no ore developments of value to report.

KOSSUTH.—The erection of the new hoisting works is completed, the machinery working to perfection. Sinking the shaft is making excellent progress; it is now down 20 ft.

FRANKLIN. — The main west tunnel is still driven ahead, without change of interest to report.

IMPERIAL. — Prospecting the lower levels continues without change of interest to report.

HALE & NORCROSS.—The usual amount of prospecting is being done on the lower levels, with no developments of value since our last report. Daily yield 50 tons of ore from the old upper workings.

SENATOR.—Hoisting the water from the shaft, preparatory to resuming sinking, is making rapid progress. Sinking will be resumed as soon as the water is drained.

YELLOW JACKET.—Cross-cutting and prospecting the lower levels, as usual, with no change or developments of value to record.

JACOB LITTLE.—Still drifting on the ore-body found in the east cross-cut from the main west tunnel.

MINT.—The south-east cross-cut from the main east drift at the second station is in 50 ft., cutting through the ledge, which at this point is 10 ft. in width, of low grade ore. The course of the drift has been changed more to the eastward so as to follow the line of the ledge and prospect it at convenient intervals by running cross-cuts.

LOWER COMSTOCK.—The shaft is down 100 ft., the contract for sinking to that depth being finished. Another contract will be let and the sinking resumed in a very short time. This is an excellent location, and when the ledge is reached will no doubt richly reward its owners for their outlay.

SIERRA NEVADA.—Daily yield from 55 to 60 tons of ore, keeping the mill steady running. There is little or no change to report in either the looks or yield of the ore-producing sections of the mine. Prospecting the upper level continues, without further development of interest to note.

DAYTON.—The main west drift at the first station tapped the ledge on Wednesday last, developing a body of fine ore, the extent of which is not known. The main west drift at the second station, 340-ft. level is in 80 ft. showing indications of a near approach to the main ledge.

CROWN POINT EXTENSION.—The shaft is down 100 ft., and the sinking suspended for the present, pending the letting of another contract. As soon as that is consummated, which will be in a very few days, sinking the shaft will be resumed.

CALEDONIA.—Preparations are being rapidly completed for working the ore bodies developed last week on the 500-ft. level. Daily yield of ore, 50 tons. This ore is mostly extracted from the ore breasts on the 400-ft. level. The Sappbiro mill is kept steadily running on ore from the mine.

Arizona.

MOHAVE COUNTY.

CEDAR VALLEY.—Mr. H. A. Eastman, arrived here about the middle of the week, from this county. In a conversation with him, we learned that a great deal of work is being done in Wallapai and Cedar Valley districts, that a new nest of ledges has been found beyond Cedar Valley district, to which men were rushing.

PIMA COUNTY.

COPPER.—We see by the Tucson *Citizen* that Mr. Brown of Tucson, has had men at work on some copper lodes west of Tucson—said to be rich—which he is about to "patent."

YAVAPAI COUNTY.

NEW DISCOVERY.—The recent discovery of a pretty rich silver lode, near Bowers' Agua Fria ranch, about 18 miles east of Prescott, has raised quite a breeze in Prescott and vicinity. The first specimens from the lode were brought to town, last week, by Col. Jas. M. Barucy and Mr. Wm. B. Hellings. They contain silver in various combinations. The rock is of a dark reddish color, compact and close grained, just such rock as we would stoop to pick up in almost any mining locality. Assays of it have been made by Mr. L. B Jewell of this place, not one of which has given a poorer result than $800 to the ton, while others went away up into the thousands.

Upon these results having been made known, there was quite a rush to secure extension claims on the lode, which is now located for an immense distance. Mr. Herbert Bowers was one of those who struck for the ledge Tuesday last. He has since returned with the flattering news that, besides being rich, the ledge is large.

Messrs. Barney & Hellings have control of several hundred feet of the lode, and will straightway set men at word upon it, and ship some of the ore to San Francisco. They may, ere long, work the ore at the mine, good facilities for this purpose being close by.

TIGER.—Governor Safford has moved in the good cause of trying to induce capitalists to take hold of the Tiger mine, in Bradshaw district, which he looks upon with great favor, thinking it a second Comstock. He has written to persons in London, who desire to purchase good property of this kind.

WAR EAGLE.—Jackson & Co. are still working the War Eagle lode, and other parties are taking ore from other ledges in the same vicinity.

BENJAMIN.—We have no later news than that published last week, from Mr. A. O. Noyes, concerning the resumption of work on the Benjamin mine, near Prescott, a mine that is too rich to be allowed to much longer remain idle.

WALNUT GROVE.—Colonel Cany returned to town last week, from a trip to Walnut Grove and Weaver districts, in both of which he says many good lodes exist. He is preparing for a trip to San Francisco, with the view of inducing moneyed friends there to invest in some of the mines.

SMITH'S MILL.—The news from Smith's mill, near Wickenburg, is, of course, encouraging. The mill is running and paying handsomely. The success of its indomitable proprietor is now settled, and well does he deserve success.

BIG BUG.—Mr. Bashford of this place is in receipt of a letter from the Big Bug Mining Company, which letter informs Mr. B. that the mill is in good condition, ledges as rich as ever, so that the closest scrutiny of the keenest mining sharp cannot find a flaw in this splendid property. About the usual amount of placer mining is doing in this vicinity, and gold dust is not all scarce.

WE UNDERSTAND that Dr. Brenau is about to publish a monthly "Scientific Health Journal" in this city, which will be called "Dr. Brenan's Note Book," and will be published for the purpose of giving advice on various subjects not generally treated by other papers. He claims that a paper of the kind proposed has never been published before. The doctor is well known on this coast, and in the East as an eloquent, witty lecturer, and if as ready a writer ought to publish a good paper.

MILL AND MINING PROPERTY.—Attention is called to an advertisement in another column of an important sale of mining property comprising the Auburn Quartz Mill and water right, near Reno; the Alpha mine at Rye Patch; the Whitmore and North Sheba mines, near Star City,, Nevada; rights for use of Stelefeldt furnace in Humboldt Co., Nevada.

THE COINER of the Mint in this city delivered to the Superintendent one day this week $300,000, the largest delivery ever made at one time since the Mint has been runniug.

The Crown Point Ore Body—History and Description.

In last weak's issue we gave at some length a synopsis of the progress of the Crown Point Mine during the past year. Ae the superintendent's report gives an excellent description of the wonderful ore body iu the mine, and as it has become the incentive which urgss on so many other minee on the Comstock, we devots considerable spacs to matter condenssd from the report referred to

Superintendent's Report.

J. D. Fry, Esq., president Crown Point gold and silver mining company, DEAR SIR: The last gensral rsport submitted hy the Supsrintendent was dated May 1st, 1870. At that time the Crown point mine was yielding nothing. Work in the mine was principally confined to the 1100 feet level, where a prospecting drift had been driven due east from the shaft a distance of 800 feet. at which point; nothing but porphyry and barren seams of quartz having been exposed throughout its entire length, it was discontinued. It being apparent that further exploration in that direction wonld prove futile, a drift was started almost due eouth of the above mentioned drift at a point 360 feet eaet of the shaft and 101 feet south of the north boundary line. In this drift at a point 340 feet south of the north boundary line, a clay-wall, running N. E. and S. W., was diagonally traversed. The drift wae then tnrned directly east, and continued for 20 feet through soft whitish qnartz, containing occasional spots of ore. It next cut a formation of porphyry ab ·ut 10 feet in thickness, somewhat decomposed and resembling soapstone in appearance, which proved to be the west or foot wall of an ore-body about one foot wide and bounded on the east by a hard casing. The ore coneisted of boulders encased in cement, which would yield in the mill about $40 per ton. The drift wae then further continued in a southeasterly direction 38 feet, skirting the foot wall, when the ore body euddenly widened to 13 feet, and continued at that width for 20 feet further south, at which point the east wall made rapidly toward the east until the ore-body had attained a width of 84 feet. The drift was extended nntil the southern houndary line of the claim was reached, developing a continuous and uniform body of ore its entire length. Thie ore-body was also explored by a raise along the west wall, which dipe eaeterly at an angle of about 38degrees, until it reached the 1000 foot level, where it was intersected by a drift from the main ehaft, after which it was followed by a series of winzes and raises to the 900 feet level. How much higher it may extend will be determined by future explorations. But little is as yet known of the extent of the ore-body on the 900 feet level, the prospecting being confined to a drift 80 feet in length commencing at the southern boundary line and running northerly. Throughout the entire length of thie drift a body of ore, nine feet in width, was found, which averaged $28 per ton.

The ore-body on the 1000 feet level is 200 feet in length, and hae an average width of about 45 feet. But little ore has been extracted from this level, the entire workings being confined to an area 190 feet long, with an average hight of 23 feet. The ore on this and the 900 feet level is held as a reserve in case of an accident to the main incline or machinery, which might impede or temporarily prevent work on the lower levels. The 1000 feet level is in good condition to work at any time; the drifts and shutes are in good repair, and ventilation ie secured by winzes connectcd with the 900 feet level.

The ore-body on the 1100 feet level is 255 feet in length by 58 feet in width, aud has been worked out for a distance of 240 feet north of the south line. On this level there are from 30,000 to 40,000 tons of low grade ore stowed away in cribs, carefully marked and available for extraction at any time, which will yield a small margin of profit over the cost of hoisting and reducing.

While the upper levels are being prospected, the main incline was driven steadily down, preparatory to opening and exploring the 1200 feet level, As soon as this level wae reached, a station was cut out and a drift started south, following the course of the west wall, and continued until the southern boundary line was reached. From this drift two cross-cuts were made—one 120 feet and the other 220 feet from the south line. The former showed the vein to be 118 feet in width and the latter 76 feet. The very rich ore on this level wae confined to the 15 fest next to the weet wall; the remainder of the ore was of very good quality and character and remarkably free from waste. The ore-body on this level is 310 feet in length, and averages about 70 feet in width, about three-fifthe of which have been extracted and reduced. This is excluesive of the eastern ore-body, hereinafter described, which has uot been worked at all.

In brcasting out on the sill-floor of the 1200 foot level, at a point 102 feet east of the west wall and 100 feet north of the south line, a hard flinty wall of quartz was strnck, which wae coneidered the eastern boundary of the pay ore and practically the east or hangiug wall. In order to ascertain how far east thie barren quartz would extend, a cross-cut was started at the point referred to and driven 36 feet east, where ore of very fine quality was found, six feet wide, and bounded on the east by a porphyry wall, which is now believed to be the eaet wall. The course of this new ore-body is south, 36 degrees sast, and it has been followed by a drift to ths south boundary lins, showing orc of the same good quality all the way. This drift was also extended northerly until it interscected the south cross-cut, exposing the sams character of ore throughout ite entire length. A winzs was then commsnced at the point where the cross-cut first struck ths ore, and continued down along the east wall, which here dips easterly at an angls of about 32 degrees, and has now reached a dspth of 120 feet on ths lins of the dip, or 70 fest vertically, showing excellent ore the entire distance. This ors-body has been further explored from the third and fifth floore of the 1300 feet level and, in order that my description of the same may be continuous, I will complets it before describing the opening and working of that lsvel.

On the fifth floor, 1300 feet lsvel, in hreasting out at a point 100 feet north of the south line and 90 feet east of the west wall, the same barren wall of quartz was encountered, which has been hitherto referred to, as the apparent eastern bonndary of the pay ore on the 1200 feet level. From this point a cross-cut was made to intersect the above mentioned winze. Sixty feet east of the starting point ore of fair quality was found, which will, with a little assorting yield $35 to $40 per ton. This lasted for 20 feet, when a formation of porphyry, 16 feet in width, wae cut, followed by another body of ore of excellent quality, averaging $80 per ton, which continued for 27 feet, where the intersection with the winze was completed. The entire length of this cross-cut, it will be seen, is 123 feet, of which 47 feet is solid ore, and the entire distance between walls 213 feet, of which 137 feet is ore.

A similar cross-cut was started on the third floor of the 1300 feet level, at a point 35 feet north of the south line and 72 feet east of the west wall. Ninety-one feet east of the place of beginning a body of ore was struck four feet wide, which averages $70 per tou. Next to this was found a formation of porphyry, which continned for seven feet, at the end of which another body of ore was cut, ten feet wide, which averages $90 per ton, and is bounded on the east by the hanging wall. Still another cross-cut has been started to intersect the winze, at a point on the sill-floor of the 1300 feet level, directly under the cross-cut on the fifth floor. Thie last cross-cut is now in 47 feet, and has cut thus far only barren quartz and porphyry, not having yet reached the point where the eastern ore-body should be fouud. As this ore-body was only six feet wide where first struck on the sill-floor of the 1200 feet level, and had already increaeed to 47 feet in width at the fifth floor of the 1300 feet level, a still further increase in width may be reasonably expected on the sill-floor of that level.

The ore-body in the 1300 fcet level is 360 feet in length, and has an average width of 90 feet. This is by far the richest and moet extensive level ever opened on the Comstock lode. It will be remembered that on the 1200 fcet level the very rich ore was confined to a belt, 15 feet in width, lying next to the west wall. On the 1300 feet level the rich ore is confined to no particular part, but the whole level showe a high and uniform grade of ore from wall to wall. On this level niue floors have been opened for a distance of 165 feet north of the south liue, and on every floor ore of excellent quality has bsen found. The remaining 195 feet has not been worked at all, and even in the nine floore referred to an immense amount of first class ore yet remains. The ore in the northern half of the level, however appears to be of lower grade than that in the southern half, and is not expected to yield more than two-thirds as much. The 1300 fcet level has already yielded about $4,000,000 in bullion, and will probably yield about $10,000,000 more, about 75 per ceut. of which will be net profit. The following table shows the average yield per ton for the six months just past—during the last three mouths of which a large proportiou of the ore extracted came from thie level—aud indicates more clearly than any description the extraordinary increase in the value of the ore:

Average per ton for	November,	1872.....	$30.58
" " "	December,	1872.....	32.95
" " "	January,	1873.....	41.18
" " "	February,	1873.....	61.98
" " "	March,	1873.....	70.72
" " "	April,	1873.....	82.11

On the 1400 feet level a large and commodious station has been cut out, and a double drift run from it 142 feet south, from which point the level will be opened at the earliest practicable moment.

The main incline has also been driven down to the 1500 feet level, and preparations made to cut out the station there.

A recapitulation of the foregoing details will enable one to acquire a very good general idea of the form and character of the great Crown Point bonanza. It may be briefly described as an immense wedge-shaped body of ore, with its edge uppermost, having a strike or course N. W. and S. E., and penetrating the earth with an easterly dip of about 36 degreee.

On the 900 feet level the upper edge or apex has been developed for 80 feet in length, with an average width of 9 feet, and au average value of about $28 per ton.

On the 1000 feet level the ore-body is 200 feet in length, with an average width of 45 feet, and an average value of $32 per ton.

On the 1100 fset level it is 255 feet in length, with an average width of 58 feet, and an average value of about $37 per ton.

On the 1200 feet level it is 310 feet in length, with an average width of 70 fset, and an average valus of about $45 per ton.

On the 1300 fset level it is 360 feet in length, with an average width of 90 feet, and an average value of about $75 per ton.

It thus appears that the ore-body has steadily increased in length, width and richness as we have dsecended upon it, and there is every indication of its continuing to do so. Much significance has been attached, and I think justly, to the fact, that evsi since this chimnsy of ors was struck, the various aeams and etratifications of whatever kind, whethsr clay, porphyry, barreu quartz or ore, have uniformly maintained about the same course and dip as the walls encasing them. When it is remembered that in the ors-bodies worked prior to this discovery thers was no such uniformity, but the chimneys were as likely to stand vertically as any othsr way, it is fair to presume that ws havs passed below the range of surface disturbance, and that the vsin will penetrate ths earth in its present shape to an indefinite depth.

From this immense chimney we have extracted and worked about onc-eeventh of the ore between the 900 and 1000 feet levels, abont four-fifths of the ore between the 1000 and 1100 feet levels, and about three-fifths of the ore between the 1100 and 1200 feet levels, and about one-fourth of the ore between the 1200 and 1300 feet levels. Above the 900 feet level the ore remains untouched. In the aggregate, we have taken out and crushed from May 1st, 1871, to May 1st, 1873, 217,421 10-2000 tons, which have given a grose yeild of $9,944,783.57, and an average yield of $45.73 per ton. We have in reserve and available for immediate extraction the remainder of the ore, as indicated by the foregoing figures, in the levels above the 1300th, and have now everything in readiness to open the 1400 and 1500 feet levels.

In addition we have made a new and very promising development, as hitherto described, in the 1200 and 1300 feet levels, eastward of the main chimney, which seems to be the upper portion of another wedge-shaped ore-body, similar to and overlapping that first diecovered. This may continue in depth, as an independent chimney, or unite with the other to form one large ore-body. I regard thé latter as the more probable, but in either event the importance of this development can hardly be overestimated.

Brief History of a Placer Claim.

A correspondent of the *Engineering and Mining Journal* writes from Washington Gulch, M. T., as follows:

SIR—On the 1st of April, 1872, I went up on the side of a bar, pnt down a prospect-hole to bed rock, and washed out sixty cents. Then, without further trial, I claimed the surplus water of the gulch, constructed the necessary ditches, dame and gatee, and proceeded to ground-sluice on the bed-rock, using a space about three feet wide, formed by the bank on the one eide, and by the rocks picked out of the ground-sluice on the other, as a race to carry off the tailings as I advanced.

Iu this way, in ahout a month, the length of time the water lasted, I ran off an area of 200 feet long and forty feet wide, and in depth from two to eight feet. So far, it had been nearly all work and no money; at long intervals I picked up pieces worth two or three dollars, and, two or three times, ten to fifteen dollar nuggets. Now comes tbe time to clean np the bed-rock. This was a hard slate, which had to be taken up and washed for a depth of from two inches to two and even three feet; aleo any loose gravel that remained on the eurface. How this was done, I will now endeavor to show, and in doing so I think I can prove that it requires the excercise of a little braine, as well as a great deal of muscle, to succeed at mining. The ground where I was at work had been, three or fonr years previously, taken up by a party, and proved to pay sufficiently well, while they had water to work it, during the snmmer; but, so soon as the water lowered every season—eome time in the latter part of June—the water of the gulch was conveyed in a small ditch into an adjacent reservoir, which left but one inch available for them. After they had given up, and I had taken hold, the same state of things contiaued. By an "inch" I mean 2½ cubic feet per minute. This, I believe, is engineers' measurement; and, to eome extent, that used in California, though not in Montana.

The first thing I did was to erect a structure, after the fashion of a log cabin, 5 feet high, 16 feet long, and about 5 feet wide. On this I placed a "dump-box," 12 feet long, 32 inches wide, and 15 inches high, and a "mouth-piece" 4 feet long, and in width so shaped as to connect the dump-box with a string of three or more flume-boxes, 16 inchee wide. All these boxes, to be used for sluicing, I set *down* the gulch, giving them a grade of 9 inchee in 12 feet; six more boxes, of the usual length, 12 feet, I set *up* along the gulch, to be used as a reservoir. The grade these got, was as follows: first box, ¼ in.; second, ½ in.; third, ¾ in.; fourth, 1 in.; fifth, 1½ in.; and sixth, 2 inches.

The size of the boards used in this reservoir flume was: sides, 18x1 inch; bottoms, 16x1¼ inch. So you see, when full, it contained an hour's water; and, by reason of the curve-like grade, when the gate at the lower eud was raised to a sufficient hight, a *steady* etream flowed through the dump-box, washing from five to eight barrowfuls at a time. This amount of water, so used, wae sufficient to keep one man eteady at work; and, if reservoired dnring the night would of conrse bs eufficient for two. Nor did the contrivance canse any more trouble than if the water was running steadily, as, when a man dumped hie last barrow, he could raise the gate, and shut it again from where he stood. In addition, I will say that the washing-boxes wsre placed on two long poles (36 ft.), so fixed in a simple way at the upper end that the lower end could be swung around in a fsw moments as ths place became filled up with tailings.

As any one of ordinary ingennity can supply ths details of this story for himself, I will end by saying I got one thousand dollare that season for my trouble—one-eighth of which I took out in a single day—a sort of day that seldom smiles on ths Montana mines.

The St. John Quicksilver Mine.

The work of developing ths St. John mine is being prosecuted with unabated vigor. New buildings are being erected; new drifts, ehafts, etc., are being etarted; new roads are being graded, old ones repaired. In fact, all is life and bustle there, and quite a village hae sprung up dnring the past few months. Since onr last report of the progress at the mine, some four new buildinge have been erected, making twelve in all. Three new tunnels have been started, one of which hae been driven in over 200 ft. during the past forty days. This tunnel is expected to tap the eame floor of metal opened in the "Vallejo drift" on a level 100 ft. above. It is eetimated that it will take thirty days to reach the ledge. Should they find the metal, as anticipated, the value of the mine will be greatly increased. This floor, as bsfore stated in previous descriptions of the mine, was opened on the eurface, and wae subsequently tapped by the "Vallejo drift," on a level of seventy-five ft. below; and it is from this drift that the principal portion of the ore reduced since the etarting of the furnace, has been taken out; now, should they find the floor in the new tnnnel, it is firmly established that there is a deposit of metal thirty feet wide, extending from the surface of the ground to a depth of 175 ft.; and there is every probability that it extends hundreds of feet further dowu.

Marion Drift.

A new drift has been etarted, named as above, a short dietance above the boarding-houee. It is in about seventy-five ft. A small vein of metal has been struck here, of a fair grade, with indications of the close proximity of a larger body of ore.

Quicksilver Shipments.

The Company redneed with their little 6-ton furnace, and shipped to San Francisco during the month of July, 200 flasks of metal and 75 flasks last week, which is the largest shipment they have yet made in one week. Last month, several days in running the furnace were lost by accidente in the management of the furnace, or the shipments of metals would have been one-third larger.

New Road.

The Company ou Satnrday last let the contract to George Smith, for the constructien of a road from the mine, through the Hunter tract, to the county road back of Lake Chabot. This new road will shorten the distance to the mine fully one mile. It is estimated that by the new proposed road the mine will be five miles distant from Vallejo. The contract calls for the completion of the road in thirty days.—*Vallejo Chronicle.*

INVESTING IN UTAH MINES. — Within the past nine months, citizens of the State of Michigan have invested about nine hnndred thousand dollars in Utah mining propertiee; and one capitalist from that State, now here, is satisfied that five millions more from the eame State, will be invested in like property before Spring. This is the showing that the peninsula State makes. And now comee St. Louie, with investmente and examinatione of property. The St. Lonis Mining and Tunneling Company, of which Mayor Brown of that city is Preeident, hae been operating on Peruvian Hill, Little Cottonwood, for eome time with the most satisfactory resnlts. A deputation of gentlemen, consisting of Mayor Brown, Meesrs. J. A. Jackson and P. Behr, of St. Louis, and Messrs. S. Haas and G. L. Bradbury, of Council Bluffs, recently visited the property of the company on Peruvian Hill, inspected the Clipper tunnel, owned by them, and the Clipper ledge, which is being run in tap, and were so satisfied with them and the other claime owned by the company, that they felt like making further investments. Mayor Brown left some days ago for San Francisco, while the other geutlemen rsmained and continued their investigations. After inspecting a number of claims, some of them developed to a considerable extent, Messrs. Jackson, Bent and Haas secured the service of competent experts and continued their investigations; and subsequently made purchase of a group of minee in the bend above Grizzly Flat, where some of the finest leads in the Territory are opened up. From assays made yesterday by five of the leading assayere in this city, ore taken from one of these claims, and the one best developed, carried $538 per ton in silver and fifty-one per cent. lead; while the lowest assay from another claim showed $37 in eilver with a high percentage of lead, and this from but a little below the surface. These are excellent prospects, while the locality ie one of unquestionahle richness.—*Salt Lake Herald.*

Useful Information.

A New Variety of Opium.

A new variety of opium has been met with in commerce for some time, which, according to a recent medical journal, is said to be obtained from Persia. This opium occurs in the form of conical cakes weighing about a pound avoirdupois, is partially covered by the remains of poppy leaves. It is free from seeds of Rumex; its odor differs from that of Smyrna opium, being rather comparable to that of green coffee, and when it is heated an odor of chocolate is exhaled. It is soft like ordinary fresh opium, the softness being due to 5:6 per cent. of moisture. When well dried it is easily powdered, but it is slightly deliquescent. The paste is of a fawn color, and does not darken on exposure to the air; and when examined by the naked eye or with the aid of a glass appears fine and very homogeneous. It mixes freely with cold water, without requiring to be much worked up in the liquid, which it only slightly colors.

Whilst Smyrna opium usually yields 49 per cent. of aqueous extract, this variety yields 52 per cent. In this operation it always presents a remarkable peculiarity; when two-thirds of the water has been evaporated in a water-bath, successive crystalline crusts are formed in such a manner that if the liquor be left to cool, a nearly solid mass results, in consequence of the interlacing of the crystals. By treating such a product with water, M. Carles separated 1.10 per cent. of pure narcotine.

An analysis of the crude opium, gives as the mean of two operations—morphine, 8.40 per cent., narcotine 3.60 per cent., that is to say, a smaller proportion of morphine than Smyrna opium.

A New Class of Explosives.—Nobel's discovery in 1864 of effecting the explosion of nitro-glycerine and analogous substances by means of a detonating charge has initiated a new era in the history of explosives. An explosion may be regarded as the sudden release of that force which previously held together the molecules of gaseous matter, and explosives are those solids and liquids which can suddenly assume the gaseous state. Heat is usually the cause of this change, so that explosions, as a rule, are simply rapid combustions of compounds which yield gaseous products; the higher the higher the temperature produced, of course, the more these gases are expanded, and the more powerful the explosion. On examining a large number of mixtures of oxidizing and combustible substances, it is found that mixtures of nitric acid, density 1. 5, and nitro-compounds of the hydrocarbons, fired by a detonating cap, are the most effective. A mixture of nitro-benzole, or picric acid, with nitric acid, explodes with the greatest violence, comparable to nitro-glycerine. The materials are harmless as long as they are kept separate, and then may be mixed with comparative ease. Something is gained even when one only of the components is liquid, and with this object I propose the use of porous cakes of potassium chlorate, saturated with a combustible liquid, such as bisulphide of carbon or nitro-benzole. These are found to be five times as effective as an equal weight of gunpowder in open granite quarries.—*Dr. H. Sprennel.*

Tea.—A tea plantation is a very pretty sight; when seen at a distance, it looks like a shrubbery of evergreens, the leaves of the plant being of a rich dark green. Green tea is multiplied by seeds which are ripe in October; when gathered they are put into a basket and mixed with sand and earth in a damp state, and kept in this condition till spring. In March the seeds are taken from the basket and placed in the ground. They are sown thickly in rows in some some spare corner of the tea farm. After picking, green leaves are spread out thickly on flat bamboo twigs to dry off their moisture; they are then placed in roasting-pans, and rapidly moved about and shaken up with both hands. When affected by the heat and flaccid they are placed on a rolling table. Several men then roll the balls to get rid of the moisture and twist the leaves. They are then shaken out on flat trays, after which they are then taken to the roasting-pan and thrown in again. The second part of the process consists in winnowing the tea through sieves in order to get rid of dust, and to divide the tea into "Gunpowder," "Hyson," "Twankay," etc. The process of curing black tea is about the same, only the leaves are permitted to lie longer after picking, and are tossed in the air and beaten by the hands. The Chinese never color teas for themselves. It is entirely done for the foreign market.

Iron for Specific Purposes.—The quality of bar iron may differ according to the purpose for which it is to be employed. Wire-iron is manufactured in the charcoal forge and the double puddling furnaces with iron hoshes. Easily welded iron is made by allowing a small portion of carbon to remain in the metal, and by expelling, so far as possible, foreign matter. But this, by destroying the fibre, will make iron cold short. If we want fibrous railway or heavy bar iron, we must employ a metal from which the carbon is easily expelled, as that from the run-out fires. This is to be puddled in a very warm furnace. Wire-iron should be of the same quality, but the puddling by which it is produced would be inapplicable for railway iron, for the latter would become cold short. Iron for small rods, hoops, gas-pipe, and wire ought to exhibit a crystalline fracture, a steel-like grain, which is produced by carbon. But of all other foreign matter it should be free. Silex and phosphorus will not evaporate like carbon on repeated exposure to heat; and the iron which contains either in a non-vitrified state will be cold short under all circumstances, and will be useless for wire or any other purpose for which strength is required.

How Hot Iron May be Handled.

About the year 1809, one Lionetto, a Spaniard, astonished not only the ignorant, but chemists and other men of science by the impunity with which he handled red-hot iron and molten lead, drank boiling oil, and performed other feats equally miraculous. While he was at Naples he attracted the attention of Professor Sementem, who narrowly watched all his operations and endeavored to discover his secret. Sementem's efforts, after performing several experiments upon himself, were finally crowned with success. He found that by friction with sulphuric acid, diluted with water, the skin might be made insensible to the action of the heat of red-hot iron; a solution of alum, evaporated until it become spongy, appeared to be still more effectual. After having rubbed the parts which were rendered, in some degree, incombustible with hard soap, he discovered on the application of hot iron, that their insensibility was increased. He then determined on again rubbing the parts with soap, and after this found that the hot iron not only occasioned no pain, but that it actually did not burn the hair. Being thus far satisfied, the professor applied hard soap to his tongue until it became insensible to the heat of the iron; and after having placed an ointment composed of soap mixed with a solution of alum upon it, boiling oil did not burn it. While the oil remained on the tongue a slight hissing was heard, similar to that of hot iron, when thrust into water; the oil soon cooled, and was then swallowed without danger. Several scientific men have since successfully repeated the experiment of Professor Sementem.

Perfumes.—Fair readers may be interested to learn where, for the most part, the flowers grow the sweet perfume of which is found in those pretty *flacons* on their dressing-tables. The chief places of their growth are the south of France and Piedmont, namely, Montpellier, Grasse, Nimes, Cannes, and Nice; these two last especially are the paradise of violets, and furnish a yearly product of about 13,000 pounds of violet blossoms. Nice produces a harvest of 100,000 pounds of orange blossoms, and Cannes as much again, and of a finer color. Five hundred pounds of orange blossoms yield about two pounds of pure Neroli oil. At Cannes the accacia thrives well, and produces yearly about 9,000 pounds of accacia blossoms. One great perfumery distillery at Cannes uses yearly about 140,000 pounds of orange blossoms, (Acacia Farnesiana,) 140,000 pounds of rose leaves, 32,000 pounds of jessamine blossoms, 20,000 pounds of violets, and 8,000 pounds of tube-roses, together with a great many other sweet herbs. The extraction of the ethereal oils, the small quantities of which are mixed in the flowers with such large quantities of other vegetable juices that it requires about 600 pounds of rose leaves to win one ounce of otto of roses demands, a very careful treatment. The French, favored by their climate, are the most active, although not always the most careful preparers of perfume; half of the world is furnished by this branch of their industry.

Care of the Teeth.—Rousseau said that no woman with fine teeth could be ugly. Any female mouth with a good set of teeth is kissable. The too early loss of the first teeth has an unfavorable influence upon the beauty and durability of the second. The youngest should accordingly be made to take care of them. All that is necessary is to brush them several times a day with a little ordinary soap or magnesia and water. After eating, the particles of food should be carefully removed from the teeth by means of a toothpick of quill or wood, but never of metal. Camphorated and acid tooth powders are injurious, both to the enamel and the gums, and if employed, every particle should be removed from the gums by careful rinsing. The habit which some ladies have of using a bit of lemon, though it may whiten the teeth and give a temporary firmness and color to the gums, is fatal to the enamel, as are all acids. No one, young or old, should turn their jaws into nutcrackers, and it is even dangerous for women to bite off, as they often do, the ends of the thread in sewing. It is not safe to bring very hot food or drink, especially if immediately followed by anything cold, in contact with the teeth.

Musty Barrels.—Many barrels at this season of the year are found to have become musty, and consequently unfit for use. The Ohio *Farmer* says: "Put in them about a pint of unslacked, fresh lime; pour thereon one or two gallons of water; bung up and shake the barrel; while shaking, loosen the bung occasionally, to give vent. When it has stood three to six hours, pour out, and rinse with clean, cold water; if not perfectly sweet, repeat the dose. Usually one application will be sufficient."

Irving received about $240,000 for his entire literary labors, and no American author has equaled him.

Good Health.

The Cholera Moving.

Steadily but surely is the cholera advancing westwardly; and if we can rely upon our exchanges it has already crossed the Mississippi. Still there is no assurance that it will reach California this season or next, yet it will be well to be prepared for its coming, by the adoption of sanitary measures and the practice of cleanliness and moderation in indulgences.

Prevention Better than Cure.

"More than forty years ago," says the New York Journal of Commerce, "when it was found that prevention for the Asiatic cholera was easier than cure, the learned doctors of both hemispheres drew up a prescription, which was published (for working people) in the New York *Sun*, and took the name of "The Sun Cholera Mixture." Our contemporary never lent its name to a better article. We have seen it in constant use for nearly two score years, and found it to be the best remedy for looseness of the bowels ever yet devised. It is to be commended for several reasons. It is not to be mixed with liquor, and therefore will not be used as an alcoholic beverage. Its ingredients are well known among all the common people, and it will have no prejudice to combat; each of the materials is in equal proportion to the others, and it may therefore be componnded without professional skill; and as the dose is so very small, it may be carried in a tiny phial in the waistcoat pocket, and be always at hand. It is: Tinct. opii, capsici, rhei co., menth. pip., campho.

Mix the above in equal parts; dose, ten to thirty drops. In plain terms, take equal parts tincture of opium, red pepper, rhubarb, peppermint and camphor, and mix them for use. In case of diarrhœa, take a dose of ten or twenty drops in 3 or 4 teaspoonfuls of water. No one who has this by him and takes it in time will ever have the cholera. We commend it to our Western friends, and hope that the receipt will be widely published. Even when no cholera is anticipated, it is an excellent remedy for ordinary summer complaint."—*Exchange.*

Springing Out of Bed a Bad Practice.—Dr. Hall does not approve of the old doctrine which was formerly instilled into the minds of children—that they should spring out of bed the instant they awake in the morning. He says that up to eighteen years every child should be allowed to rest in bed, after the sleep is over, until they feel as if they had rather get up than not. It is a very great mistake for persons, old or young—especially children and feeble or sedentary persons—to bounce out of bed the moment they wake up; all our instincts shrink from it, and fiercely kick against it. Fifteen or twenty minutes spent in gradually waking up, after the eyes are opened, and in turning over and stretching the limbs, do as much good as sound sleep, because the operations set the blood in motion by degrees, tending to equalize the circulation; for during sleep the blood tends to stagnation, the heart beats feebly and slowly, and to shock the system by bouncing up in an instant and sending the blood in overwhelming quantities to the heart, causing it to assume a gallop where the instant before it was in a creep, is the greatest absurdity. This instantaneous bouncing out of bed as soon as the eyes are open will be followed by weariness long before noon.

Teeth Set on Edge.—All acid foods, drinks, medicines, and tooth-washes and powders, are very injurious to the teeth. If a tooth is put in cider, vinegar, lemon-juice or tartaric acid, in a few hours the enamel will be completely destroyed, so that it can be removed by the finger-nail as if it were chalk. Most people have experienced what is commonly called teeth set on edge. The explanation of it is, the acid of the fruit that has been eaten has so far softened the enamel of the tooth that the least pressure is felt by the exceedingly small nerves which pervade the thin membrance connecting the enamel and the bony part of the tooth. Such an effect can not be produced without injuring the enamel. True, it will become hard again, when the acid has been removed by the fluids of the mouth, just as an egg-shell that has been softened in this way becomes hard again by being put in the water. When the effect of sour fruit on the teeth subsides, they feel as well as ever, but they are not as well. And the oftener it is repeated, the sooner the disastrous consequences will be manifested.

Lemons or Oranges in Sick Rooms.—Lemons or oranges remaining any length of time in a sick room produce a very unpleasant effect upon the atmosphere. I have often observed this in the rooms of persons dying of consumption, and supposed it was the disease that tainted the air, but mature experience has taught me my mistake. Sick persons generally want lemons and oranges, and they also give a cheerful cooling look to the room, but their sickly fragrance is so unpleasant that they should be banished entirely except as they are needed for immediate use by the patient.—*Hearth and Home.*

Domestic Economy.

Raspberry Jelly.—To each pint of juice allow ¾ lb. of loaf sugar. Let the raspberries be freshly gathered, quite ripe, and picked from the stalks; put them into a large jar, after breaking the fruit a little with a wooden spoon, and place this jar, covered, in a saucepan of boiling water. When the juice is well drawn, which will be in from three-quarters to one hour, strain the fruit through a fine hair sieve or cloth, measure the juice, and to every pint allow the above proportion of loaf sugar. Put the juice and sugar into a preserving pan, place it over the fire, and boil gently until the jelly thickens when a little is poured on a plate; carefully remove all the scum as it rises, pour the jelly into pots, cover down, and keep in a dry place. This jelly answers for making raspberry cream, and for flavoring various sweet dishes, when in winter, the fresh fruit is not obtainable.

Green-Corn Pudding.—Allow one long ear of sweet-corn for each person. Take half a pint of milk, one egg, a dessert spoonful of white sugar, one of sweet butter and add a teaspoonful of salt to every two ears.

Beat the eggs and sugar well together and add the milk and salt. Cut the corn off the cobs with a sharp knife, and chop the divided grains with a chopping knife, but not too fine; or, better still, split each row of corn down the middle before cutting them off their cobs. The corn must not be boiled first. Stir the chopped corn into the milk, and bake in a brisk oven in custard cups or in a tin-pan until the top is nicely browned, but not hardened. Serve hot, with sauce. This is a delicate dish. Common corn may be used, if young and tender, but requires as much again sugar.

Pineapple Preserve.—To every pound of fruit, weighed after being pared, allow one pound of loaf sugar and quarter of a pint of water. The pines should be perfectly sound, but ripe. Cut them into rather thick slices, as the fruit shrinks very much in boiling; pare off the rind carefully, that none of the pine be wasted, and in doing so notch it in and out, as the edge cannot be smoothly cut without great waste. Dissolve a portion of the sugar in a preserving pan with quarter of a pint of water; when this is melted, gradually add the remainder of the sugar, and boil until it forms a clear syrup, skimming well. As soon as this is done put in the pieces of pine, and boil well for at least half an hour, or until it looks nearly transparent. Put it into pots, cover down when cold, and store away in a dry place.—*Queen.*

Iron Rust in Stockings.—Wet the spot with milk, and then cover it with common salt. This will do if the article has not been washed. Another plan is to take an ounce of powdered oxalic acid, and mix it with four ounces of cream tartar. Keep this in a box. To use this, wet the finger in clean water, dip it in the above powder and rub it on the spot gently, keeping it rather moist until the stain disappears. Then wash the spot out with pure water. Another plan is to wet the mark with yellow sulphate of ammonium, which will blacken it. After a minute or two wash out the spot with clean water, and then treat the spot with cold dilute muriatic acid. Afterwards wash with clean water again.

Tomato Honey.—To each pound of tomatoes allow the grated peel of a lemon and six fresh peach leaves; boil them slowly till they are all to pieces, then squeeze them through a bag; to each pound of liquid allow a pound of sugar and the juice of one lemon; boil them together till they become a thick jelly; then put them into glasses and lay double tissue paper over the top.

Delicious Food.—No part of any animal used for food is more delicious to many people than the brain when well cooked. It may be fried in butter, boiled in milk, and then placed in vinegar, or boiled in water two or three minutes, then beaten fine, mingled with sage, salt, yolk of an egg, a gill of cream and fried in the form of drop cakes in butter. Before cooking it should be carefully washed.

Apple Jam.—Weigh equal quantities of sugar and good sour apples; pare, core and chop the apples fine; make a good clear syrup of the sugar; add the apples, juice and grated rind of three lemons, and a few pieces of white ginger. Boil it until the apple looks clear and yellow. On no account omit the ginger.

POSSIBLE.—In San Joaquin County a man is under arrest for stealing a mowing machine. This is probably the individual who attempted to walk off with a quertz mill some time ago.—*Chronicle.*

The *Chronicle* gives the above item probably under the impression that an individual can't "walk off" with a quartz mill. We assure our cotemporary that we know of many well authenticated instances where individuals have "walked off" with quartz mills, and big ones at that; moreover, in some cases, they gobbled up the mine in the bargain. The circumstance has'nt happened once, but many times. Though they did'nt literally put the mills in their pockets, they did the coin which was paid to build the mill. These facts will be attested by hundreds of men, rich in mining experience, but poor in purse. It looks as if it would be more difficult to steal a mine than a mill, but one is equally as easy as the other, provided you know the ropes and are in with the California street rings. A movable threshing machine is nothing to a quartz ledge which one would suppose was a fixture; but many a one has melted into thin air and carried a heavy weight of coin with it.

VIENNA AWARDS.—We see by a dispatch that among the awards at the Vienna Exposition, were the following for the Pacific Coast: Joseph Nenman, of California, for cocoons; G. Kuetel of California, for minerals; Sutro Tunnel Co. of Nevada, for mine models. Little Neumann must be in high feather over his success, for he had such a terrible time in getting to Vienna, and may have a worse time getting back here. We are particularly glad to see that Mr Kuetel's efforts in making a collection of minerals, meagre though it was, met with some appreciation.

A MILL is to be built for Peavine District, and according to the Reno *Crescent*, the lumber for it is now being cut.

About Quicksilver Extraction.

In our issue of June 14th, 1873, was published a communication from Mr. Guido Kustel, our Vienna correspondent, in relation to Patera's quicksilver furnace. He stated that the officers of Idria admitted a loss of 37 per cent., as compared with the usual assay, but the usual assay by retorting, compared with the analysis, shows a heavy loss besides. "The analysis of a series of samples compared with the retort assay gave an average with the following results: Idria assays, 3.94 per cent. Analysis of the same 5.00 per cent." This shows 12 per cent. loss by the assay, and with the above loss of 37 per cent. it would amount to 49 per cent. real loss. Patera claims to work up to 84 per cent. of the real amount the ore contains, and Mr. Kustel examined tailings, from which there was no reaction of quicksilver obtained.

A correspondent of a cotemporary, referring to our article, thought that Patera was making small progress in his improvements, as viewed from a California standpoint, stating that, with all the new methods in vogue in Europe, the average loss remains far greater than the most wasteful process in vogue in this State. The correspondent further stated that the loss at Almaden is not above 5 or 6 per cent.; while the Coalt & Roach and the Knox & Osborne and other processes claim to work within one per cent. of assay value; and where wood could be had at $5 per cord, at a cost of $1.25 per ton for ordinary selected rock, reduced to egg size.

Now our friend Mr. Kustel, whose experience and reputation entitle him to a respectful hearing, does not believe the statements of the correspondent referred to above, and his opinion is shared by many others. Very few apparatuses of any kind work as close practically as they are supposed to theoretically. In conversation with one of the owners, of one of the prominent California quicksilver furnaces, this week, he said he could work the ore up to within one-half of one per cent. of assay value, or 99½ per cent., an assertion that will be doubted by many besides ourselves. A certain percentage of the metal will go into the bricks of the furnace, and into the ground under and about it. When one of the furnaces at New Almaden was torn down some years since, traces of mercury were found at a depth of 20 feet under where it had stood. Some people however, who are indentified with certain metallurgical processes, have a "hobby" of the "percentage" business, and make accurate calculations on paper, which practice seldom bears out. We remember overhearing some years ago a conversation on this subject, in a stage coach while on a trip to Washoe. An enthusiastic individual who had purchased some newly invented pans for a new mill, was talking about their capabilities and had picked up a few ideas from the inventor, while he had but indifferent knowledge of the subject himself. He stated in all good faith, that he expected the pans to work up to 105 per cent. of assay value. This is an isolated case, but many others are scarcely less reckless in their assertions than this incipient mill men. The subject is better understood now-a-days, but still we have a good deal to learn about actual loss of metal in ore.

In speaking of the matter above referred to, Mr. Kustel writes us from Vienna as follows: There is little doubt that improvements are proposed and carried out in California more frequently and quickly than in any other part of the world, and are often very successful, as illustrated by our quartz batteries, which stand above the European in every respect; but the "California Standpoint" is a very peculiar thing. The correspondent who writes in reference to the Patera Process, and says the loss of quicksilver at New Almaden is 5 or 6 per cent. while the Coalt & Roach and the Knox & Osborne, and other processes claim to get out 99 per cent. is like many others. It is not surprising to read such statements; and on the other hand it would not really be surprising, if by a little more improvement it was claimed that from 120 to 125 per cent. could be extracted; that is, it would not be surprising from a "California standpoint." An assayer, who understands his business, would be congratulated if he were able to extract 95 per cent. of the quicksilver contained in rich ore, not to speak of the poor; and it must be admitted that a distilling furnace never can be made as perfect and hermetically tight as it is possible to construct an apparatus on a small scale in an assay office. But there is no use to talk about an imaginary 99 per cent. Belief is required; nothing else. All one can say is that the inventors of the 95 and 99 per cent. processes have it in their hands to make a fortune by introducing them in Europe, where 40 per cent. of quicksilver is lost, and where this metal can be traced ten thousand feet away from the furnaces for a foot deep in the ground. This quicksilver is a dead loss, but in tearing down a furnace, tons of it are obtained from below the foundation; where the balance of the 40 or 50 per cent. goes to is not known. It may be, from a "California standpoint," an imaginary loss; but the Idria people, for instance, who have worked on quicksilver ore for more than a century, know and admit the loss. They have been experimenting to find out the real loss, not to save 99 per cent., which is thought impracticable, and in this investigation they differ a little from California methods, which may account for the different results. Tell them that in California 95 per cent. of the quicksilver is extracted, they smile without any remark; but if any one can *prove* to them that he can extract 90 per cent. of the mercury contained in the ore, he is a "made man."

Of course we understand very well that the new processes introduced within the past few years for the extraction of mercury from its ores, are very great improvements on those in vogue ten or twelve years ago; and no doubt they save more metal. But that they work as close as represented, is doubtful. At the Phœnix mine, in Napa County, the fumes are led over 100 feet *after* leaving the condensers, which are supposed to extract all the metal. At the end of this long process means are adopted to catch escaping mercurial vapors, and the Superintendent of the mine lately informed one of the gentlemen connected with this office that he caught at the end of this pipe about $50 worth of quicksilver every month. How much is lost, of course we do not know; nor does he. If some of our friends connected with the quicksilver mines of the Coast who have made experiments in this direction, will give us the benefit of their experience, they may rest assured it will be appreciated. Let some one, where one of the furnaces referred to is in operation, suspend a gold coin for a short time in front of the air passing from the furnace, after it has gone through all the processes, and see the result. Let him tell us what proportion of quicksilver is caught in each separate condenser, especially the last, for if any is caught there it is highly probable that some escapes.

Beet Sugarie at Sacramento.

It is gratifying to learn of the very flattering prospects attending the opening of the season's campaign at the sugarie of the Sacramento Company. The season has been a fair average for the growth of beets; the yield per acre from 20 to 30 tons, and the quality better than in any preceeding year, showing a saccharine percentage ranging from 10 to 15 per cent. of the gross weight of the beets; the working factory yield slightly exceeding 10 per cent.

The season's operations were commenced on the 5th of August, being a full month earlier than is attainable in European countries. Eighty tons of beets are required and worked every twenty-four hours. To run the sugarie twenty-four hours requires the labor and attendance of sixty men, working a single shift, or thirty men on and thirty off, one shift commencing at midday, the other at midnight, this division of the time being preferred by the men to any other.

Except a few white overseers, the workmen are Chinese. White men have been tried, with a view of employing them solely; but they are found to be less reliable, less inclined to do as directed, and not as quick to discern what is required or to do it, as Chinamen; the men on being told that they must neither smoke or chew tobacco inside the sugarie, understand it, and refrain. Not so with white laborers, who seem to think the rule is to apply to any but themselves.

Working a sugarie amidst the heat of furnaces, the steam of engines, boilers and evaporators, is a very warm business to say the least, and will start the sweat from the coolest inclined; but with each shift of hands, every Chinaman comes on with his clean towel suspended upon his breast or convenient for use, whilst bathing twice a day is made a *sine qua non*, indeed they seem to vie with each other in the matter of cleanliness.

If there are any who longer doubt the complete success of the best sugar enterprise in California, they should visit the Sacramento sugarie any time this fall or winter, while in full tide of operation, and they will be convinced of just two facts in regard to the business of sugar making from beets; one being the large outlay required in getting up the necessary machinery for the business, and the other, the unquestionably large profits that must attend the manufacture.

We have, at 414 Clay street, a sample of sugar from the factory of the present season's make, which we would like to have examined and tested by those interested in home productions.

The Utah Silver and Lead Company.

We see by the London mining *World*, that a meeting of this company was held in London on July 25.

Mr. G. Batters, the Chairman, gave a *resume* of the past operations and the progress of the new company. Alluding to Mr. Longmaid, the present Superintendent, he said: "I have known him for the last twenty-five years as a competent man in his profession. Before his departure for Salt Lake City, he made himself acquainted with all the machinery that would be required for dressing the ores. He also spoke in the highest terms of Mr. Argall, the present Secretary.

The Chairman likewise said "that Mr. J. P. Sewell, brother of Mr. Henry Sewell, the eminent mining engineer, was also at the meeting, and that he would like very much to have him on the Directory."

Mr. Lake also moved the election of Mr. J. P. Sewell, for he knew that his brother out in Utah had always taken the warmest interest in the success of the company. He knew them both, and entertained the highest opinion of them.

Mr. J. C. Bateman was also reëlected a director.

The Salt Lake *Journal* thinks the Company is destined to be a permanent-paying concern. The new Superintendent, Mr. Longmeid, who lately arrived from London, is a mining engineer of many years' practical experience. He has expressed himself in the very highest terms about the great value of this mine, and the immense quantities of ore in sight. As regards the concentration of second-class ores, he has proved this to be a complete success—raising the ore from 35 to 75 per cent. in lead, and from 17 to 20 ounces in silver. As soon as the rest of the concentrating machinery arrives from England, he is confident he can save more silver and raise the percentage to 25 ounces.

We are fully cognizant how our old friend and correspondent, Mr. Henry Sewell, has fought this battle against all comers. He also holds £600 worth of stock in the new company, which he invested, to prove his faith tangibly in the mines of the company, notwithstanding the bad management. This is one of the many proofs how ignorant and reckless management will cause a collapse in the best mining property.

Charges of Transportation.

The Subject to be Investigated by a Senate Committee Sitting in San Francisco.

Senator Casserly announces that the sub-Committee of the Senate on Transportation, will begin its sessions in this city, on August 26th. In a communication he states that among the heads of inquiry within the powers of the Committee, the following have special reference to the Pacific Coast and its interests:

First—Charges for transportation of grain, wool, ores and other staple products, and of freight generally, by land or water, including: 1—Charges of transportation, storage, etc., from the interior to tide-water. 2—Freights from ports on the Pacific to foreign ports, for the past five years and upwards. And how these charges compare with those elsewhere in the United States.

Second—Discriminations in charges of transportation, as between way freight through freight, and as between freight of either of these classes; or in respect of any other classification.

Third—How far these charges of transportation by rail are in excess of what the staple products of the Coast should be made to pay; or of what is a fair return upon a fair outlay for construction, repairs and running expenses; having in view the public aid granted to the company.

Fourth—Value and amount of the different kinds of grain produced in California and Oregon annually, for the last ten years. Value and amount of the same exported from each of these States annually, for the same period. Same statistics as to flour.

The inquiry will not be confined to these heads, but will extend to all matters bearing on the subject of transportation, inland or by sea.

The sessions of the Committee will be public. All persons specially interested, are invited to be present, and to give any facts in their possession throwing light upon the injury.

The co-operation of Commercial Boards and other business bodies, as well as that of farmers' organizations—in furnishing information to the Committee—is specially desired.

Another Labor-Saving Machine — The Blodgett Road-Scraper.

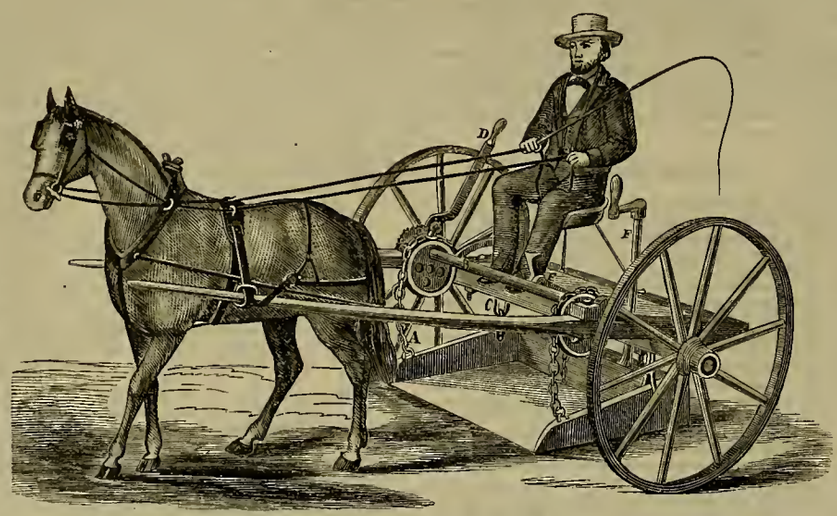
The accompanying illnstration represents a device just being introduced into California, called the "Blodgett Road-Scraper," which has many apparent advantages over other implements constructed for similar purposes. The mannor of operation will ho easily seen hy reference to the cut. Tho scraper or hody, *A*, is suspended by means of links and chains under the axle and hetween the wheels, as shown. Across the shafts, in front of tho axle, is placed a shaft, *B*, having an eccentric at each end, around which chains pass and are attached to the front end of the scraper. The lever, *D*, at one side, on the right hand of the driver, serves to operate these eccentrics, and raise or lower the front end of the scraper as desired. Behind this level is a har with a pawl, which engages in a ratchet at the lower end of the lever, *D*. This pawl-bar on being lifted, disenguges the pawl, and the scraper is allowed to drop to take on the load. A crank is secured to n vortical shaft, *F*, on the left of the driver, and when it is desired to discharge the load, hy turning this crank, the bottom of the scraper drops open. A foot lever, *E*, which connects with the hind end of the scraper by means of a chain, serves to raise the bottom again.

There is one part of the apparatns which tho engraver hae omitted to show. The bottom of the ecraper ie divided into two parts, hinged together. A short distance from the front of tho scraper the hinges are placed, and a rod at the bottom of the rod, *F*, keeps the hinder part up when the load is on, and whon it is desired to dump it, the rod, *F*, is turned, when the under part falls and tho load is discharged. The machine operates as follows; The driver assumes his seat, and when at the place where the load ie to be taken on, he raises the lever behind the lever, *D*, at his right hand, when the front part of the ecraper *A*, is lowered to the ground.

The hind end being firmly held in poeition by the links, *C*, a short distance above the ground, the scraper is thue inclinod forward in the usual position of a common scraper. The forward motion of the horse eerves to fill the body of tho machiue with dirt. When the scraper ie full, the driver operates the lever, *D*, which, being connected with the bar, *B*, and the eccentrics, moves easily and raises the front end of the scraper as high as necessary. This operation inclines the scraper to the rear, so the load slidee off easily. The load is drawn, without tho necessity of the horse stopping, to where it is to be dumped. The driver then turns the crank, *F*, which drops the hind portion of the bottom of the scrsper, and the whole scraper being inclined to the rear, the load discharges itself. The driver then puts hie foot on the lover, *E*, which raisee up the hind portion of the bottom of the scraper, and again secures it in position by meaus of the rod, *F*.

As will he eeen, the machine ie a very simple one and may be used for many purposes. Not only for a road scraper, hut for grading, digging ditches, levelling off ground, etc. For mining ditches in many locslitiee it would answer very well. For diggiug irrigating ditches and canale it bears the same relation to common ecrapore and wheelbarrowe, as a "eteam paddy," or mud dredger, does to a dnmp cart and man with a shovel. The driver is not compelled to travel at the tail of the machine all day, but has a comfortable seat on which to ride. There is no necessity for the horse to stop at all and a good deal more work can accordingly be accompliehed in a day with this than with a common ecraper. For farm work it would be very convenient, since the body being under the wheels, manure, dirt, etc., could be moved from place to place without the necessity of ueing pitchforke or shovels, and the animsl draws all the weight and carries none. Heavy stones can be moved in this machiue, as the front end of the scraper, which is shod with eteel, can be run under the stone and it can be raised with the lever.

We are informed that some three thousand of these machinee are now in use in the Easteru States, more particularly on farme and railroads. It is just being introduced on this coast, by an incorporation called the Blodgett Road Scraper Manufacturing Oo. The president of the company, Mr. H. K. Moore, No. 528 California st., informs us that one of the machines is now being made in this city, which is to be used in making tront ponds and ditches, and a nnmber more have been contracted for. The irrigation projects of the San Joaquin Valley, which are going on in an extensive scale, will probahly necessitate the manufacture of qnite a nnmher of these machines, which aro peculiarly fitted for that work. It is the intention of the company to dispose of theso machines at a rate which will place them within tho reach of all desiring to use them.



BLODGETT'S ROAD SCRAPER.

Improvements in Refining Coppery Bullion.

In working "tailings" from tho ores of the Comstock lode a large addition of blue stone is generally made, which forms no inconsiderable portion of the expense of the process. Tailings therefrom always yield an amalgam very rich in copper, and also very "coppery" bullion. This is a drawhack of tho process. Besides that, in selling the bullion, tho copper is not paid for, and the cost of refining such hullion is always larger than for refining common hars. Copper is much less soluhle in sulphuric acid than silver, and bars of a high percentage of copper reqnire more time, fuel, and acid, than those with little or no copper. If the per centage of copper exceeds 10 to 15 per cent, it is ever necessary to alloy euch bare with others, in order to ohtain a mixture soluble in enlphurio acid. As a consequence, coppery bars sell on this coast at a larger discouut thsn the usual Comstock bullion.

To refine a bar of 1000 ouncee, 800 fine in gold and silver, with 20 per cent of copper, costs in this city, st two cents per ounce, $20, of which eum $4 is paid for the 200 ounces of copper. Each pound avoirdupois of copper, therefore, coste 29 cents for refining. Now the above 200 ounces, or 13.7 pounds, avoirdupoie of copper have been, dnring the amslgamation, reduced from 54.8 pounds of blue etone, for which the mill owner has paid—at say 12 cents per pound—$6 57; that is 48 cents for one pound of copper. Thue the mill owner instead of receiviug something for the copper in the bulliou, loses not less than 77 cents for each pound of it. This fact certainly leaves a margin for improvement.

The facte being well know, experimente have been tried in some tailing mills, to roaet the retorted amalgam in a reverberatory furnace and to remove the oxidized copper by means of sulphuric acid. This method, which has been practiced in Europe for centuries, is feasible enough, if judiciously practiced. The roasting of copper in reverberatory furnsces is, however, a rather impracticable operation. It is a source of loss in silver and in time. The reverberatory flame ie to much of a reducing flame to csuse a powerful oxidation of the metal. The amalgam becomes covered with ashes and soot, which in "pickling" makes the solution turhid and the silver, owing to the presence of the carbon, refractory in the crucible.

Mr. Frederick Gutzkow of this city, in view of the foregoiug facts, has devised a modification of the old procese, which presents some advantages. It is in substsnce as follows: By this new method the roasting of the amalgam is effected in the same retort in which the retorting takes place. Most of tho quicksilver is removed hy distillation in the ordinary way. Then the firing being kept np, a strong current of air is forced through the porous mass. The air enters through opening of the door and after passing through and over the contents, escapes through the same pipe, which previously served for the escape of the qnicksilver vapors. The strong draught required is effected hy means of a steam jet. For that purposo a gas pipe hranches off from the outlet of the quicksilver vapors and ends in an iron T piece, on which a small steam jet creates a vacuum.

The mixture of steam and air is made to pass through cold water, before escaping into the atmosphere, in order to condenso any partieles of silver or quicksilver that might be carried away. It is not necessary to delay the admission of air until tho last traces of quicksilver have distilled off, as the distillation will keep on with the oxidation of the copper, and is even facilitated by the current of air. The more porous the mass is left the more effectual the oxidation will be. The little steam jet apparatus can be connected with any retort without trouble, and causes no expense worth mention, unless where steam is not availsble.

It is commonly believed, that for the purpose of freeing silver from copper by oxidizing the latter, the operation has to be frequently repeated. This, Mr. Gutzkow thinks, is not necessary. The oxide of copper formed does not prevent the further oxidation of the copper in the heat. There is something similar in it to the oxidation of iron in moist air. In both cases combinatione of metals and oxygen are formed, which tranemit some of the oxygen to the metal core, then take up fresh oxygen, and so on. Mr. Gutzkow eaye he has frequently cupelled silver bars with forty and more per cent. of copper, and obtained pure silver therefrom, when the metal itself wae only touched by the air blast for a few minutes at the commencement. It very soon became covered with a thin fluid consisting of a mixture of oxide and protoxide of copper, which increaeed to a thickness of one or two inches, acting on the metal below nearly ae powerful ae the blast would have done.

The sufficiently oxidized amalgam (a perfect separation of copper aud silver is not intended) is taken from the retort in the usual way and placed in a lead-lined tank filled with sulphuric acid. The oxide of copper dissolves and the silver remains as it is. Silver being, however, also somewhat oxidizable, a little of it will always be found disolved. A few sheete of copper precipitate it easily. The settled solution is withdrawn and either used over again until it ie etrong enough to separate crystals of bluestone, or, better still, given directly into the amalgamators instead of the bluestone of commerce. There have been some tables prepared, which indicate the percentage of bluestone in a solution of a certain strength. According to these tables one gallon of blue-stone solution of 10 degrees Beaumé containe one pound; one gallon of 17 degrees two pounds; one of 23 degrees, three pounds of bluestone disolved. The silver residue in the tank ie thrown in a filter, washed with hot water and then dried and melted. The first wash water ie mixed with a proper smount of sulphuric acid and saved for another operation. The weak wash may be run off without incurring much of a loss.

The costs of the operation Mr. Gutzkow eays, consist principally in the expenee of sulphuric acid. For one pound of copper to be oxidized may be reckoned one and a half pounds of sulphuric acid. For the above mentioned silver bar of 1,000 ounces troy or 68½ pounds avoirdupois, with 20 per cent of copper, about 20 pounds of acid are reqnired, costing in Washoe say $1.20. Therefrom 54.8 pounds of bluestone are formed—valne $6.57. Besides, $4.00 gained by the higher value of the bullion as explained above. It is to be hoped that some of the Washoe mill men will give this method of Mr. Gutukow's a trial. If any further information is desired he can be addressed, corner Columbia and Harrison streets, in this city.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents]

By Special Dispatch, Dated Washington, D. C., August 19th, 1873.

For Week Ending August 5th, 1873."

Window-Fastening.—William A. Hawthorne and Edgar E. Scott, Carson City, Nevada.

Stamp for Crushing Ores.—Geo. D. Crocker, S. F., Cal.

"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

San Francisco Microscopical Society.

On Thursday evening, August 14th, Dr. J. H. Wythe delivered a lecture at the Mercantile Library Hall, on Microscopical Investigation, before the San Francisco Microecopical Society and its numeroue friends. After the lecture the following objects were exhibited nnder microscopes:

Polariscope.--Folsom Granite, Salicine, Chloride of Barium, Bi-Tartrate of Thallium. Exhibited by H. G. Hanke.

Dark Field. — Polycistina, Selected Diatoms, Arsenioue Acid, Sautonine. Exhibited by C. M. Kinne.

Transparent.—Liver of Rattlesnake, Foot of Tree Toad, Section of Indian Corn, Scale of Butterfly. Exhibited by D. P. Belknap.

Diatomace.—Arachnoidiscus, Thiceratium, Pleurasigma, Melosira. Exhibited by Henry C. Hyde.

Promiscuous.—Blood Circulation iu Living Frog, Shelle of Embryo Oysters, Horn of Rhinoceros, Tartrate of Lime (moving). Exhibited by Charles G. Ewing.

Opaque.—Elytron of Diamond Beetle, Star Fish, Wing of Atlas Moth, Feru Leaf. Exhibited by George A. Raymond.

Rock Sections.—Labrador Porphyry, Melaphyre, Petrified Wood, Diatom Mud. Exhibited by James Blake, M. D.

Metals.—Native Gold Cryetals, Native Silver, Native Moes Copper, Volcanic Iron. Exhibited by Gen. John Heweton.

Minerals. — Cinnahar in Chalcedony, Gold (from Gold Bluff), Silicified Wood, Gem Sand. Exhibited by Charles H. Denison.

Insects.—Larvæ of Lady-bird, Marsh Fly, Spit Fly, Ant. Exhibited by Melville Atwood.

Pathological.—Hepatic Vein, Oblique Section of Mnscle, Papillæ of the Tongue, Trichina Spiralis from Muscle. Exhibited by Fred'k Hiller, M. D.

Microscopical Photographs.—Charlee Dickens, Miss Amy Sedgwick, Suffer Little Children, Engine Room S. S. "Great Eastern." Exhibited by John J. Hncks.

Living Frog.—Circulation of Blood. Exhibited by H. J. Holmee.

Histology.—Sectiou of a human bone, Section of fœtal Hand, Structure of Nerve, Injected Vessels of Liver. Exhibited by Rev. J. H. Wythe, M. D.

Natural History. — Spiculæ of Alcyonium, Spiral Cells Cobœa Scandens, Scalee of Diamond Beetle, Arachnoidiecus Formosus. Exhibited by Arthur B. Stout, M. D.

During this exhibition some very good music was furnished. The Committee of Arrangements had evidently done all in their power to render the entertainment most agreeable. The Society ie now etrong and very prosperone. The rooms are at No. 649 Clay Street. The apparatus, microscopes, polariscopes, etc., ie well selected and is being constantly added to.

It is reported in Salt Lake that an effort is to be made by the Cincinnati victims of the Wyoming mine ewindle to expose and punish the guilty partiee.

Butte County Mines.

Editors Press:—Perhaps a few notes from the mining section of Butte county may be of intereet to some of your readers. In this county there have been, are at present and are yet to he, without doubt, some of the richest and most extensive placer mines in this State. In the immediate vicinity of Oroville, the mining interest ie rather dull, hnt in passing helow town, yon are hardly heyond the town limits when you see some of the effects of the recent excitement in thie locality. The Cbinamen, of whom there are about 3,000 here at present, have so completely gophered ont the old chaparal flats for five or six miles around, that it is dangerous attempting to navigate off from the main roads witbout a guide. It is being mined hy Chinamen only, and in precisely the same way as hy a few of them who have been working on these flats for years; that is, hy rockere, and they are making, it is thonght, from $4 to $10 per day.

Some of these claims have changed hands at large prices. A few of the people have found locating, for the purpose of selling to tbe Chinese, quite profitahle. Claims are proepecting well in the agricultural district abont eight miles below Oroville.

Most of the old vineyards and orchards near are being rapidly turned upside down. At Cberokee Flat, the Spring Valley and Cherokee Mining Companies, which were coneolidated last spring, have just completed their ditch from Butte Creek, crossing the west hranch of Feather River, connecting with the former ditch of S. M. Co. This now furnishes a good snpply of water, running two and tbree seven-inch pipes. The number of pipes will he increased to five during the winter. The company expects to receive $2,000 on an average each working day, which is quite prohahle, as $1,000 were produced for each day's washing of the first season. After completing the S. M. ditcb, and, notwithstanding all experimenting, $750,000 have already been expended on improvements. The stock, which is $4,000,000, is valued at 75 per cent., and will pay, it ie said, two per cent. monthly on that amount.

The bringing of water to this ground in such abundance was certainly a gigantic enterprise, and the result will probably continue, as thns far, proportionately great.

Tbis lead is said to extend from about eight miles north of Cherokee to Tbomson Flat in the south, and is from two to four miles wide. It can be justlv claimed as one of the richest and most exteusive gravel deposits in the State, and, as has heen quite appropriately eaid hy others, "the gold-bearing material is here in inexhaustible quantities and visible masses, and to he turned to usefulness only awaits the hand of industry and energy." F. G. S.

Cherokee, July 1873.

The Origin of Metals.

The origin of mining recedes into the obscurity of the most remote history. The origin of metals is still more mysterious. Some of tbe *elite* of moderu German philosophers attribute their formatiou to the raye of the sun. Like the light aud heat emitted by coal during combustion, which are now helieved to be the deposits of tho sun's rays treasured up for us through thousands of centuries, so tbe metals are presumed to be deposits of the sun's material suhstance emitted hy its rays, and deposited upou our own and the sister orbes of our planetary system. The theory is that all the material of which the planets of our solar system is comprised has heen "sbot out" from the groat central orh. Recent scientific discoveriee unfold the fact that all incaudescent metals give forth a flame the color of which is definite and peculiar. Tbis has been ascertained by experimeuts eo numorous and so carefully conducted hy philosophere of the highest eminence as to be iucontestihle. By this meaus it is ascertaiued the sun is a vast globe of incandecent metals, how sustained no one presumes to sap, farther than that inscrutable electric agency dominates tbe wonderful phenomena. By this merns all, or prohably all the metals known on this planet, are proved to he iu the sun, heeming with an energy seen nowbere else in nature, and sending forth rays of ligbt and heat to the congregation of worlds that wait upon the great luminary. These rays are supposed to consist of infinitesimally small particles of all the known metals, aud have been in the long history of solar existence, and mundane dependence upon it, flowing forth in a etream of luminous material from wbich tbe metallic lodes and veins of our world have derived their virtue. No doubt these were originally snrface deposits, hut gradually forced their way through the veins and crevicee they occupy hy the instrumentality of water, and were partly brought into their present positions hy eruptive powcr. The comiugling of metal ores eupports this theory: gold and silver are found together; tin and copper almost invariahly in this country; silver and lead nearly everywhere, hut in some places more particularly than others. At all events one thing ie remarkable, that while the flora and the zoological regions of the earth are well defined, metals are found in all old countriee, universally diffused as if to teach ue that they are the fonndation of universal civilization.—*Mining and Commercial Times.*

Gold Quartz in Butte County.

Mr. D. W. Gaskill, owner of the South Feather Water Ditch, has brought in a piece of the gold quartz from the vein recently discovered near Forhestown, Butte county, on Deadwood Ravine. The piece is wbite quartz, containing some gold, and hlue sulphuret-hearing quartz, with gold perceptible everywhere. This blue quartz is what they call the "pay streak," and yields so profusely that it is evidently not misnamed. Though this is called a recent discovery, it really is not so. The qnartz vein was discovered in tho bed of the creek in 1853, and tbe rock was taken out and pounded in a hand-mortar, yielding $4,000; but it was thought to be only a "pocket" and work was not further prosecuted.

Abont a montb ago, wbile piping into the hank, one hundred feet from tbe first discovery, the ledge was uncovered, and it was followed up to where the firet strike had been made, showing a pay streak of eighteen inches the whole length. Some of the rock was taken out and worked in the primitive style, with a hand-mortar, and $4,392 showed up as the result of two days work. It is estimated that $10,000 worth of ore is now in sight. This ground or part of the ledge, ie owned by Roherts, McCormick & Co., who will at once erect a mill and work the ledge systomatically. No ebaft has heen sunk lower than seventy feet heretofore, for lack of capital; but now there will he no such ohstacle to prevent tbe full development of the riches of the ledge.

Tbe ore belt runs from Forbestown to Hansonville, plainly traceahle the whole twelve miles. One thousand feet from the Roberts-McCormick strike, the same pay streak has been found. Deadwood Ravine eeems to cut the belt, and, as Garden Flat, Ohio Flat and New York Ranch all have proved very rich, it is doubtless from the gold liberated from this ledge hy the action of the rains. Forhestown Ravine, which cuts the vein twice, has proven immensely rich. From Ohio Flat, into which Deadwood Ravine empties, Gaskill & Bowers took over $100,000. From these evidences of the richness of the vein, there is the happiest result predicted for the fortunate owners of the new strike.

Build up Home Manufactures.

The following, from an exchange, contains nothing that we have not previously urged, hut the points made will bear frequent urging:

It is useless to talk of building up a prosperons and wealthy county, and thriving, independent cities and towns, when we depend so much npon assistance from the East as well as the neighboring towns and citiee of our own State. In order that a county and its towns should be self-supporting and have a free circulatiou of money among the people, we must bave consumers of the greater part of our country produce, and those consumers must compose the manufacturing class of our community. It is useless as well as detrimental to our best intereets, to talk of sending our produce to foreign markets in payment for our manufactnred articles, our clothing, and often the necessaries of life, because in this case we are doing just opposite of that which the Farmers' movement is endeavoring to prevent, and that is the payment of eo much freight at such enormous rates. We send our grain to market and pay tbe railroad companies one tbousand bushels to take tbe other thousand to market. We purchase with the money we obtain for our grain agricultural implements, euch ae plowe, harrows, reapers, mowers, rakes and wagons, and ship them home, payiug as freight the same large percentage on the cost of these implements; thus we leave no money iu tbe country. Unless we change this order of tbings and build up and patronize home manufactures we may always expect to hear the cry of hard times, scarcity of mouey, and low prices for our produce.

Pacific Borax Company.—The Pacific Borax Company ie the only incorporated company engaged in the manufacture of borax in Esmeralda Co. The company i incorporated under the laws of the State of California, with the principal office in Sau Francisco. The Board of Trusteee for the present year consists of Francis Avery, President; Justinien Caire, Robt. Marrow, M.M.Tompkins and I. Lawrence Pool. The lands now owned by this Company were snrveyed in December, 1871, for tbe origiual locators hy William McBride, then Depnty County Surveyor ot this county, and consist of ninety-five-quarter sections or 15,200 acres. The locations were made under the Act of the Nevada Legislature, approved Febrnary 24, 1865, entitled "An Act to provide for tbe location of lauds containing salt," and the company since acquiring possession from tbe original owners have been in constant occupation and complied with the provisions on the ahove mentioned law. Their lands are located partly in Fish Lake Valley and partly on Columhus Mareh; and some of them are of great value, containing deposits of horate of lime and horate of soda in variable quantities and of like variation in quality. The company have heen successfully and continually manufacturing borax at their works—located five miles from Colnmbus—since June, 1872; and now employ eighteen men. They keep two boilers of an aggregate capacity of ahout seventeen hundred gallone running day and night; and bave thirty-six cryetalizing tanks of a capacity of nearly twelve hundred gallons each.—*Borax Miner.*

Mines at Muncey Creek.

Situated 25 miles in a south-easterly direction from the town of Sbellburn, and lying between Piermont and Ruby Hill, some of tho most promising locations in Eastern Nevada have been fonnd at Muncey Creek. The ores discovered thcre consist of rich chlorides, contained in galena, and have heen traced on the croppings for a long distance. Some samples brought in recently by Fred. Plageman, one of the original locators are sufficient evidence to anyone of their richness, and peculiar fitncss for smelting purposes. The facilities necessary for a mining locality are ample, water existing in greater abundance than in any other locality found in the State; wood ahounding in large quantities and of good size and of superior quality. The main wagon road traveled from Piocbe to Toano, on the railroad, leads directly hy the locations, and transportation is conecquently always availahle. Some weeks ago a party of gentlemen visited Muncey Creek, took samples of ore from the various locations, and the assays were much more encouraging than they had been led to believe. The principal work bas been done on tbe Muncey Creek Consolidated, on which a shaft has been sunk 35 feet in depth in ore, with no limit ae yet to its width. The locatiou of the mines, the general appearance and cbaracter of the ores fonnd coincide perfectly with those on Ruby Hill, Eureka District, the float rock being a counterpart of the latter, and the accessions nearer at hand. Negotiations are now in progrese, as we are informed, for the sale of a whole or part of thie really valnable property, and, if consummated, we are confident tbat a mining camp of no mean pretentions will soon spring into existence, which may rival even Enreka in a short time. One decided advantage possessed hy tbis district is tbe large percentage of gold contained in the ores, in some instances averaging as high as $20 per ton. But slight mention has ever been made of the subject of our sketch, and hut few know the real value contained in the immense quantity of ore now in sight. We are meditating a trip out that way the present season, and sball take pains to inform ourselves more fully in regard to affaire there, for the benefit of the community at large.—*White Pine News.*

Salmon River District.

A Correepondent of the Salt Lake *Tribune* writes as follows concerning this district: Salmon River District is situated ahout fifty miles northwest from Toano, and is in Elko County, Nevada. Knowing that the newe of thie district will be read witb interest, I take the opportunity of my late visit there to give my views of it.

To hegin with, the mosquitoes, gnate and green-headed horse-flies are in abundance, and visitors going there ought to take a mosquito net with tbem for protection.

Tbe principal mines are the Mosquito, Tindale, Domingo and the Gilmott. The last-named being by far the hest, and that for copper will not amount to anythiug. The copper at fifty-five feet deep had all given out, and there was nothing but lively white quartz, which will lead to silver and gold. As for copper, I would pronounce the camp a failure, hut have every faith in ite silver and gold. It is all copper on the surface, although of a very low grade, averaging ahout twelve per cent. Another drawhack to the camp is, that the expense of working the mines is too great. Tbere is no timber within twenty-five or thirty miles, but there is water enough to warrant hoisting works, pump and engine at the depth of sixty feet. Another heavy item is tbe cost of shipping ore. At present it costs at least twenty dollare per ton to deliver it at the railroad, and in copper ore, with these drawhacks, it would require at least twenty-five per cent. ore to pay expenses; so take it all in all, I should think the miners would rejoice at tbe favorahle indications of the copper giving out and of silver and gold coming in. I expect to make another visit there ahout tbe last of thie month, and shall again communicate anything of intertest concerning the miners generally.

Railroads in South America. — The New York *Herald* says tbat among tbe important railroad improvements in progress, and which largely concern the commercial relations existing between New York and San Francisco, is one now being organized in London, on the basis of extraordinary grants from the Hondnras Government, tbe object of which ie to insure witbout delay the completion of an interoceanic railroad from Porto Caballos, on the Atlantic Coast, to the Bay of Fauzco, on the Pacific Ocean. The length of the entire line is 2,200 miles, 70 miles of which have been completed and are now in operation. By this ronte, it is said, tbe distance from New York to San Francisco will be shortened nearly 1,200 miles, as compared with the Panama route. It is also stated that an agent of the English capitalists interested in the nndertaking will arrive in New York in a few daye, for the purpose of conferring with the Pacific Mail Steamship Company, with a view of offering inducements to the eame to land tbeir steamere at Porto Cahallos and Cape Franzca on tbe completion of the road. Should the arrangement he effected, it will make a difference of four days in the time required for the transportation of freight hetween New York and San Francisco, as compared with tbe Panama route.

How Carson River is Fed.

But for the water now flowing into Carson River from the basin, or water-shed of Lake Bigler, few of tbe water-mills would be able to turn a wheel. The water tbue fed into tbe river constitutes nearly tho whole volume of that now used hy the mills. This water is taken from the streams which naturally flow from the east down into Lake Bigler, which streams are situated beyond the ridge lying betweeu us and Tahoe. In order to obtain the water of these streams, a large dam was huilt, and an artificial lake formed, called Marlette Lake, and from the lake the water is brougbt through the dividing ridge hy meane of a tunnel, 2,100 ft. in length, and so comes out on our side of the mountains, instead of flowing into Lake Tahoe, as it formerly did. The ridge thus tunnelled through is known as tbe Spooner Divide. After flowing through the tunnel in tbis dividing ridge, the water is carried away in the direction of Carson, where it is nsed in two large flumes (the Summit Flume and tbe Elliott Flume) for floating wood and timher from the mountains to the valley, and after having performed tbis service it flowe on down into Carson River and helps to run the mills. When we say that timbers sixteen inches square may be floated down the flumes mentioned, it will readily be eeen that the quantity of water flowing in each is hy no means emall. In order to bring thie water from Marlette Lake to the end of the large pipe which has just heen laid across Washoe Valley, and through whicb is to come the supply for this city, it will he necessary to build about nineteen miles of flume. The whole length of pipe and flume, when the new water worke have been completed from thie city to Marlette Lake, will be hetween fifty-two and fifty-four miles. To huild the nineteen miles of new flume required will cost about $26,000. The tunnel alone through the Spooner Divide cost ahout $30,000. Pending the thorough completion of the great work to Marlette Lake, there can be drawn from creeks tbie side of tbe dividing ridge (where it is nowheing obtained) a plentiful supply for all uees.—*Enterprise.*

Charcoal at Eureka.—The consnmption of carbon, in the allotropic state of charcoal, with the number of smelting furnacee at preeent in operation, must aggregate a great number of bushels monthly. To supply this demand requires the service of a large force of men and teams. The cutting and hauling of the timber from the localities where it is found, to the coal pits, the operation of hurning or partial comoustion, and, finally, the transportation of the coal to town, completes tbe labor immediately connected with its production. The farthest point from wbich the coal is shipped ie about twenty-five miles, but considerable is made at one-third of that distance from town; the mean distance wonld perhaps be fourteen miles. Mr. I. Whisler is extensively engaged in the business of its manufacture, and employs one hundred and eighty-six men and forty-six teams, tbe teams averaging eight animals to eacb. From this gentleman we learn that the wbole number of men employed in this branch of industry is in tbe neighborhood of one thousand, with a correspondingly large number of teams.

It wonld be very difficnlt to give accurate numbers in this estimate, since so many parties are engaged in the enterprise, and at divers distancee and localities from Eureka. Tbe above, however, is a careful estimate hy one who has an opportunity of knowing, and shows the business to be on a larger scale than we had imagined. The Richmond Company alone are receiviug at the rate of 150,000 bnshels per month.

Among others extensively engaged in tbe husiness of making charcoal are A. E. Davie, Reilly & Lockwood, Denio & Bro., and McBurry & Co.

Another item which forms no small part of the business of the district is the getting ont of timbers for tbe mines. This is done in the vicinity of the cbarcoal fields, and also engagee a large force of men and teams.—*Eureka Sentinel.*

Washoe Coal.—Speaking of Washoe coal, the *Territorial Enterprise* saye: Some partiee in this city, who are mining for coal in El Dorado Cañon, Lyon county, cigbt or ten milee beyond Dayton, are meeting with very flattering snccess. At no great depth, they have found a very promising vein of coal, several feet thick, which burns well and freely, and which contains no eulphur. The coal appeare to be lignite, and in appearance does not differ materially from other deposits of that mineral that have at various times heen opened in this scction of the State. Ahout two tons of the coal have heen brought to this city. We yesterday saw some of it tested in a small coal stove, and it eeemed to hurn about as well as any other coal could have done. A fire made of it at nine o'clock in the morning wae still burning when we saw it at half past one P. M. It leaves a considerahle quantity of ashes, whicb appears to he due to a kind of sediment composed of calcareous matter mixed with the coal at the time of its formation. At a greater depth on the vein this will doubtlese dieappear. We hope the mine may prove to he all that its owners helieve it promises to become.

Slage are said not to answer well for road-mending, ae tbey are too brittle. Bnt by allowing tbe blocks of slag to cool very slowly nnder pressure a very tough material is obtained.

Cheek.

That onr article of last week on the above subject was appreciated in the mining districts, the following from the White Pine *News* will show:

The MINING AND SCIENTIFIC PRESS, of San Francisco, has an article on "Cheek," which we cannot but admire for its truthfulness and applicability. The number of mining experts, M. E.'s, rock sharps and scientists which we have in this country is simply amazing, and their extravagant efforts to impress untutered residents with their superior knowledge of mining matters certainly ridiculous. We have seen them, in fact, see them every day, seated in barrooms and other popular places of resort, dilating upon the excellence of such a location and deriding some other, using all the time the most metalliferous expressions imaginable, and swelling up at the importance which they consider is attached to their opinions. As truly said by the MINING AND SCIENTIFIC PRESS, "the title of mining engineer is like those of M. D., Ph. B., LL. B., etc.," and must be obtained by means of a regular and strict course of study, accompanied with a final examination and diploma from some regular college empowered to grant such.

Where one student succeeds in passing a creditable examination, one hundred fail utterly, consequently we have but few amongst us who can rightly lay claim to the title of M. E. In mining countries we have suffered to a great extent from the effrontery of these so-called experts, and men who could be induced to invest in mines, are deterred from doing so through the numberless failures caused by recommendations from these itinerant gentry. The opinion of a practical, hard-fisted miner, whose occupation is to strike a drill, is of more benefit to us than a dozen high flown, illiterate, ungrammatical and senseless "reports" made by a majority of "mining engineers." In our mind's eye we very distinctly remember one gentleman who was induced to make an assay of a piece of grindstone, and pronounced it "highly metalliferous in its character," at least so the story goes. He wrote his name with the M. E. attached.

COMMERCE.—An unrestrained intercourse between the States themselves will advance the trade of each, by an interchange of their respective productions, not only for the supply of reciprocal wants at home, but for the exportation to foreign markets. The veins of commerce in every part will be replenished, and will require additional motion and vigor, from a free circulation of the commodities of every part. Commercial enterprise will have much greater scope from the diversity in the productions of different States. When the staple of one fails, from a bad harvest or unproductive crop, it can call to its aid the staple of another. The variety, not less than the value of products for exportation, contributes to the activity of foreign commerce.—*Hamilton.*

THAT FAVORITE HOME REMEDY,

PAIN-KILLER,

Has been before the public over THIRTY YEARS, and probably has a wider and better reputation than any other proprietary medicine of the present day. At this period there are but few unacquainted with the merits of the PAIN-KILLER; but, while some extol it as a liniment, they know but little of its power in easing pain when taken internally; while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all, that it is equally successful, whether used internally or externally. It is sufficient evidence of its virtues as a standard medicine to know that it is now used in all parts of the world, and that its sale is constantly increasing. No curative agent has had such a widespread sale or given such universal satisfaction.

DAVIS' PAIN-KILLER is a purely vegetable compound, prepared from the best and purest materials, and with a care that insures the most perfect uniformity in the medicine; and while it is a most effective remedy for pain, it is a perfectly safe medicine, even in the most unskillful hands.

It is eminently a FAMILY MEDICINE; and by being kept ready for immediate resort, will save many an hour of suffering, and many a dollar in time and doctor's bills.

After over thirty years trial, it is still receiving the most unqualified testimonials to its virtues, from persons of the highest character and responsibility. Eminent Physicians commend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, etc., but for Dysentery, or Cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India, and other hot climates, it has become the standard medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and all other kindred disorders, For Coughs and Colds, Canker, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine.

We would caution the public against all imitations of our preparation, either in name or style of putting up.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chloriuation Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgica operations connected with silver and gold from a preliminary examination of the ore to the final cas tin of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked: with a Chapter on the Blow-Pipe Assay of Minerals By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & CO. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees: list of Government fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco

PURCHASERS please say advertised in Scientific Press.

THE Golden Chariot mine, in Banner district San Diego county, cleaned up $12,000 on the 11th inst. This mine is the representative one of the county, and in one ot the regular mining counties of the State could be sold for a magnificent sum. The owners, however, have a good thing of it, as it is, and evince no desire to sell. One of the first crushings made yielded $230 per ton, or $23,000. One run of 50 tons milled them $160 per ton, or $8,100.52 tone crushed at another time yielded $13,621, or $257 per ton. When the mine was first opened they packed the ore on mules to the mill, hnt they have a mill of their own now, and a good wagon road to the mine. One of the owners sold his interest last January for $25,000. The mine has paid all ite expenses from the etart, the owners being all poor men and unable to put capital into it. Several other mines in this district are now doing pretty well.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

PACIFIC JUTE MANUFACTURING CO., Aug 14.—Object: To manufacture all kinds and descriptions of jute fabrics, to purchase suitable machinery, buildings and sites to carry on the business. Directors: Leopold Cahn, Abraham Block, Joseph Brandenstein, William Scholle and M. Morganthau. Capital stock, $1,000,000. The certificate states that $205,000 has been subscribed by the Directors.

DERBY M. Co., Aug. 16.—Location: Utah Territory. Directors: Daniel Bruce, C. J. Collins, C. L. Teitrean, J. Schreiber and J. S. Allen. Capital stock: $3,000,000, in shares of $100 each, of which $500,000 have been subscribed.

CAPITAL STOCK INCREASED—OVERMAN S. M. Co., Aug. 16.—The Capital stock was increased from $1,280,000 to 3,800,000, in shares of $100 each. The amount of capital stock paid in is $1,196,930.38, and there are no debts or liabilities except the ordinary floating accounts which are paid as fast as presented.

Meetings and Elections.

BALTIC CONS. M. Co., Aug 18.—The following gentlemeu were elected officers of this company for the ensuing year: Geo. W. Britton, President; R. H. Goodwin, Secretary; John Lsnders, Tressurer.

Leather Market Report.

[Reported for the PRESS by Dolliver & Bro.]

There has been a considerable improvement in business for finders since last month. Prices do not change much, but are firm. But while times are better for the jobbers, the tanners of the State have probably never experienced such dullness as has been the rule for the past few months. But now prospects for all interested in Leather appear to be brightening, and this department of trade, in common with all otbers, will no doubt be soon greatly strengthened.

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE Co. J. B. Roberts, 315 California Street, San Francisco, is general agent for thie Coast. Send to him for circulare and information of this reliable, first-class company.

CORNUCOPIA.—This new district, which has created so much excitement of late from the reported richness of its ores, already begins to share the fate of similar "excitements." Conflicting reports are in circulation in relation to the district, some of which are by no meane flattering. The Reese River *Reveille* publishes extracts of letters from partics therc of which the following is a sample:

"We have looked after the big thing, hut failed to find it as represented. I consider the thing a bilk. There are some two or three locations that show a little horn silver in the seams, but as for there being 200 tons of float that would work $200 per ton, it is not so. There are not two tons of thousand-dollar ore in the entire camp. Everything is located in the vicinity for two miles, and the ground is literally covered with monuments. Sam Grove ie leaving in disgust, as are many others. Tell all the boys who have the Cornucopia fever to stick to their chloride-holes on Lander Hill."

On the other hand people are said to be flocking to the district in numbers. Some one has ehown the Gold Hill *News* pieces of rock from the Chloride mine in Cornucopia which was assayed by Conrad Wiegand and went $17,000 per ton. These figures remind us of the time of the White Pine excitement, when ore that didn't assay over $1,000 per ton was of no value. The place must, however, work out its own salvation and a few months trial will prove ite richness or worthlessness. Of course disgusted prospectors always wreak vengance on an unlucky camp hy "running it down," while on the other hand lucky men who have good locations, will laud it to the skies. Either extreme is to he avoided, and time only proves which story is correct.

CARSON MINT.—The following is the official exhibit of the husineee of the United States Branch Mint, Carson City, Nevada, for the month of July, 1873:

Deposits.	Ounces.	Value.
Gold	10,828,078	$191,406 11
Silver	220,161,053	256,573 64
Totsl	230,419,136	$447,979 75
Coinage and bars executed		$421,085 10

To Capitalists and Hydraulic Miners.

PATENT SELF-CLEANING SLUICE.

This new and useful invention is designed to collect all the gold as fast as it is set free from the dissolving earth, and conduct it into a receptacle of mercury or safety pocket, under lock and key, from whence it may be removed in a few moments, without either checking the flow of water or interfering in the least with the washing.

The invention, if properly placed in our rivers, will also collect the gold which is yearly traveling down their channels, thus affording an annual income with a trifling expense for attending.

PURCHASERS please say advertised in Scientific Press.

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.

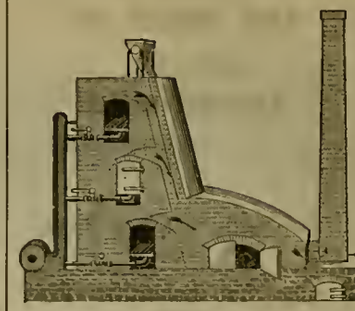
EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

Valuable Mill and Mining Property IN NEVADA,

To be Sold or Leased,

EITHER TOGETHER OR IN PARCELS.

Tbe whole of tbe magnificent propertiee lately held hy "The Nevada Land and Mining Company, Limited," conaisting of:

THE AUBURN QUARTZ MILL, near Reno, Nevada, on the O. P. R. R., run by water power, containing twenty stampe and a Stetefeldt Furnace, free of royalty; also, tbe neceseary ctorebouses, stahlee, and manager's and workingmene' bouees.

Tbe first right to the water of tbe Truckee River, more than sufficient to run 100 stampa, and forming the most valuable mill eite in tbe State of Nevada. The canal is about four milee in length, and ie used also for irrigation of land and the supply of water to the town of Reno and vicinity.

800 ACRES (about) of FERTILE LAND adjoining the town of Reno, partly laid out in town lots, and a conaiderable part of which has been under cultivation.

THE ALPHA MINE, at Rye Patch. This mine adjoins the well-known "RYE PATCH MINE," has been well developed, has produced large quantitiee of ricb ore; and is considered, in every respect, equal to tbo Rye Patch Mine.

THE WHITMORE and NORTH SHEBA MINES, which adjoin the De Soto Mine, near Star City, Nevada, and controlling interests in three mines in the Pinto District. Ore of considerable value has been obtained from theee last named minee, and they ehow fine indications, but they have not as yet been fully developed.

The exclusive right to grant licenses for tbe uee of the STETEFELDT FURNACE for tbe county of Humboldt, Nevada, and one-half of tbe royalties payable in respect tbereof.

The above propertiee constitute one of the most valuable mining aud milling invectmente ever offered to the public.

The Mill is in good running order, and has tbe well-earned reputation of working ores (especially tbose of refractory character) to a higher percentage than any other mill on the coast.

Tenders for the purchase or lease of the above properties, or any part or parte thereof, may he addressed to

MR. WILLIAM A. STORRY,
Occidental Hotel, San Francieco.
W. S. GODBE, Eeq., Salt Lake City.
MR. R. BOOH, Reno. ag23

Rope! Rope!

PACIFIC CORDAGE COMPANY,

This Factory, now in full operation, ie prepared to fill all orders for

Manila Cordage and Hay Rope,

Of all lengths and varieties—tarred or untarred—of Superior Quality to any ever offered in this market.

The Works of this Company are eo located that ordera can be shipped direct, by rail or water, to any part of the State, when so desired hy purchaeers.

MILLS FURNISHED AT SHORT NOTICE

At the lowest Market Prices.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

Tbe system of transporting material, sucb ae Ores, from the mine to the mill, Earthe for embankments, Rock from quarriee, etc., hy meane of eteel wire rope, bae been well tested and found **more economical, advantageous and reliable** than any other method of transportation; and to the annexed certificates in connection therewith I heg to call the attention of thoee interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear eir: On your leaving for San Francieco, it givee me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up hy you upon our mine in Freihurg.

It is a perfect success, discharging ten tone of ore per hour with two men's labor. It is perfectly simple in construction, and, as far ae I can judge, there is nothing about it to ever get ont of order—nothing to wear out. While oure requiree but about two thousand five hundred feet of wire ropo, I can ece no reason why the line could not be extended almost indefinitely with equally happy reeults. Again, the carrying capacity might be doubled or quadrupled if desired. After eeveral weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utan., Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may he on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one t n and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

VOLUME XXVII. Number 9.

Reported Ascent of Mount Whitney.

The *Visalia Delta* says: "Captain J. H. Adams and party report an ascent of Mount Whitney, the highest dome in America. They say that horses went to the top. If so, it is certain that ere long our exalted neighbor will be visited by thousands every summer. It is not often that so elevated a peak is thus easily accessible."

This same feat has been before accomplished by Mr. W. A. Goodycar, of the Geological Survey, and Mr. Belshaw, of Lone Pine; that is, they went up the mountain *supposed* to be Mount Whitney, and so described by Clarence King in his "Mountaineering in the Sierras," but since Mr. Goodyear's ascent he has arrived at the conclusion that the mountain referred to was not the real Mount Whitney. We published Mr. Goodyear's observations in our issue of the 16th inst. He arrives at the conclusion that the peak which, for over three years, has borne the name, has done so only by mistake, and that a new name must be found for it; while the name of Whitney must now go back to the peak to which it was originally given in 1864, and which is in reality the highest and grandest of this culminating cluster of the Sierra Nevada. Mr. Goodyear thinks there is no doubt of the reputed Mount Whitney being identical with the one Mr. King measured in 1871, as the half dollar Mr. King left on the summit has been found. The real Mount Whitney not only retains its claim to being the highest point of land in the United States of America, but its claim to over 1500 feet of absolute attitude above the sea, is also still indisputable. It also retains the *prestige* of the fact that in all probability no human foot has ever trod its summit, Mr. Adams and party, notwithstanding. As the name is applied to a peak which has a false claim to it, the probability is that the party ascended the same mountain ascended by Mr. King and Mr. Goodyear, and erroneously located as Mount Whitney, by the former. Mr. Goodyear thinks that it can be climbed, but it will certainly involve a great deal of hard and, very possibly, dangerous work for those attempting it.

It is stated that work will shortly be resumed on the Constantia lode, Yuma Co., Arizona. New machinery is now on the way to the mine.

Value of Foreign Patents.

The saying has passed into tradition that a Yankee (American) never lacks the means of accomplishing whatever he may wish to make, contrive or do. We have only to make our wants known and a legion of Yankee inventors confront us with the means of supplying them. The records of our Patent office show that we are a people full of originality, and the nations of the earth give us the credit of being first and foremost in inventions. In Europe the American origin of an invention is looked upon as a sort of guarantee that it is a good one, and those inventors who have in addition to their American patents, secured patents in Europe, have generally realized a larger profit from them than from those obtained at home. The reason of this is obvious when we consider the large amount of capital invested in the manufacturing branches of industry in England, France, and the other European countries, and the competition which is naturally created thereby. Under this state of affairs it will be readily seen that the monopoly or control of any special branch of industry, will, in a measure, free the manufacturer from the incubus of competition, and enable him to make a larger per cent. upon his invested capital.

Cheap manufactures beget cheap labor and competition begets cheap manufactures. Therefore it is policy for the manufacturer to secure a monopoly of some branch of industry which he can manage and control, independent of his neighbor and competitor. In the United States, our manufacturing business has not yet resolved itself entirely into the hands of large manufacturers, but is divided up amongst a large number of small manufacturers who are not able to control more than a limited patronage. It would not, therefore, always justify them to invest in patent rights, and being small manufacturers, there is no inducement to get up such a close competition in business as would reduce their profits. The inventor depends mostly upon supplying the wants of the manufacturers, and it therefore behooves him to secure his inventions where the largest manufacturers and the closest competition is found, and it is there he will realize the largest profits from his invention.

The Vienna Awards.—The following Associated Press dispatch comes from Vienna, dated August 25th: Of 30,000 medals awarded to exhibitors at the Exposition, 400 go to America. There is much dissatisfaction with the results of the Exposition. It is charged that a number of articles which were never entered for competition received medals, and that several firms that had none of their goods on exhibition were awarded diplomas through manipulations of the juries. The quantity of goods and specimens which will be returned home from the American department is very small. The exhibitors have been leaving in crowds as fast as they could get away, since the close of the Exposition.

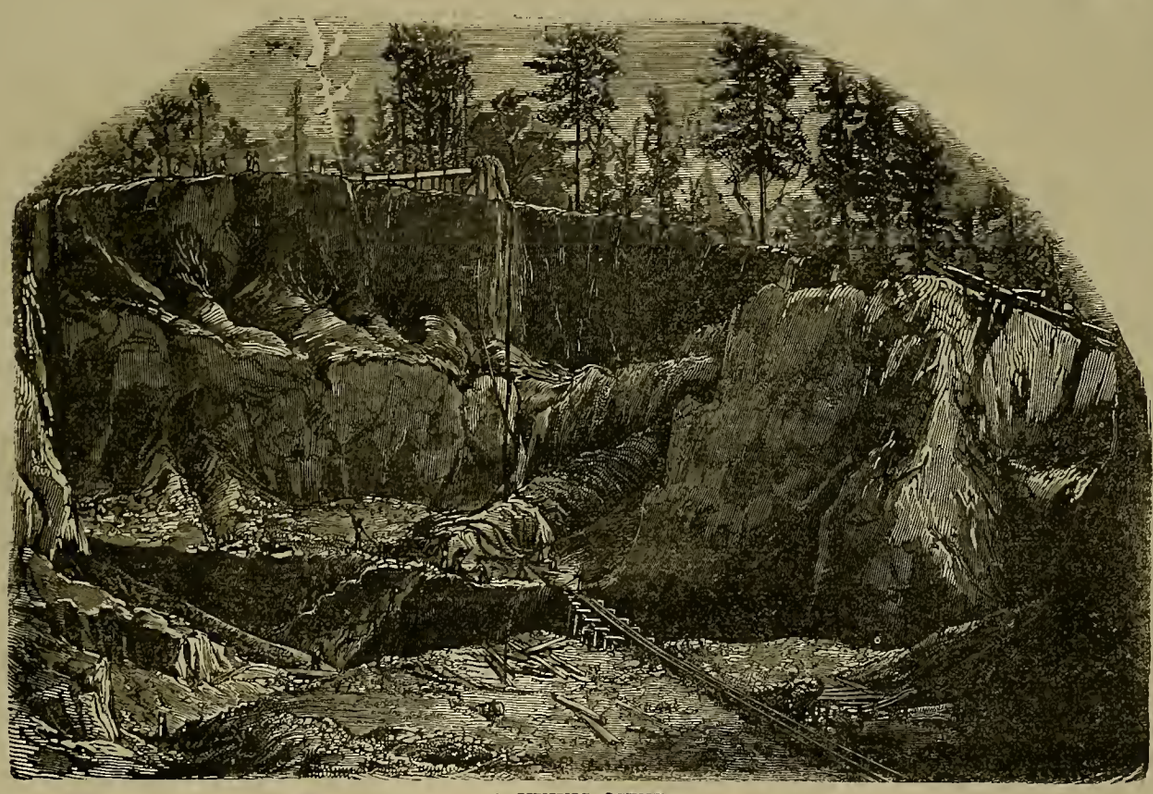
Eberhardt, White Pine, is said to be more lively than it has been for months, in consequence of the work being done by the Eberhardt and Anrora Mining Co.

An attorney has begun suit on attachment against the Emma Hill Consolidated Mining Co. for his fees—$6,000.

A Mining Scene.

The interests of the farmer and the miner go hand in hand. They are emphatically *the* producers of this coast. The more mines there are and new districts, the more chance is there for the farmer to dispose of his produce at home, and save cost of transportation to distant markets. The miners furnish the money which pays for the grain and serves as the oil in the great machinery of Commerce. Both classes want cheap transportation—one for his ores, the other for his grain—and their interests are identical in many respects.

The miners who are tearing down and washing away acres upon acres of ground with their hydraulic pipes, and immense streams of water are lifting that ground over taking out the rocks and stumps and putting it in good condition for future generations of farmers. They tear away steep sided hills, covered with boulders and rocks and unfit for agricultural purposes, and make level valleys of clean soil, which in a few years will be as rich in vegetable as it has been in mineral productions. Both miner and farmer take from the soil its treasures, though the crops are of a different nature and differently harvested.



A MINING SCENE.

The accompanying illustration shows a company of miners harvesting their crop with the simple but effective aid of a heavy stream of water and a string of sluices. They are doing it in the old fashioned way with several streams and hand nozzles. While working on the same principle now, the details are somewhat modified and immense bodies of water are used and thrown from one pipe with great pressure, the water washing away tons upon tons a day. By this process of mining, the miners, without intending it, level off large extents of country and put the hills in such a shape as will fit them for the needs of the farmers of future generations.

The "Snowy Range" mining district, eight miles north of Cariboo and one thousand feet higher, is attracting the attention of prospectors, rich silver veins having recently been discovered there.

Shipments of gold dust from Placerville, Idaho Territory, by Wells Fargo & Co., since the 1st of January amount to $144,567; this amount probably does not embrace one-half that has been taken out.

CORRESPONDENCE.

Vienna Exposition.

[By our Traveling Correspondent.]

The Exposition of Mining and Metallurgy,

Although exceedingly rich, is strictly considered only for that reasou so extensive, because combined with the metal industry, snd inasmuch quite proper, as the fiuished articles are produced in succession in tbe same establishment from tho raw ores. Of mining machinery proper, however, there is comparatively only slight representation. A variety of splendid, powerful hoisting machiuery is exhibited in a separate building, by Danck & Co., of Prague, and this is the only prominent exposition in this line. Modsls of hoisting in shafts and on inclined tracks of different construction are found here and there, scattered in the various Montan depsrtments; also, models of self-dischsrging percussion tables, jiggers aud rotating tables; but there is only one self-discharging jigger of natural size exposed in the huilding of the Austrian "Ackerbau Ministerium."

Plans of the great concentrating works at Clausthal, drawings of lead smelting furnaces of the Oberhartz, of Prachett furnaces of circular tuyeres and of Frieberg smelting furnace, are shown iu the "Montan Industry" of Germany. There is also a model of the Mansfield copper smelting furnsce tuyeres, and another of a cupelling furnace with a square hearth, from Pozibram. Miniug maps and plans of underground miuing are abundantly exhibited, some of a very lsrge size; several shafts over three thousand feet deep. Very ineteuctive are the models of coal, sslt-rock and ore mines in which shafts, inclines, drifts, levels, and worked out places are shown by iron wire or flat iron, in correct proportion of depth, length, etc. Some of the old mines show so many levels and drifts, that the model looks like s confused uetwork. Of ores, minerals and smelting products are nnmherless collections, very interestiug, but so exceedingly scattered, that it is quite tiresome to hunt them up. Boulders of malachite, pyramids of transparent salt-rock, heautiful Hungarian precious opals, rough diamonds from Africa, goldsand from the Rhine, huge petrefactions, ore collections with very large, middle sized and small specimens are profusely exhihited, but hardly one of a thousand visitors has seen them all.

The Montan Metal Industry,

Excels in iron and steel articles. There sre rsils and edge, or flsnge iron up to ninety feet in length; those of first shape 15 iuches high with 4 to 5 inch flauges; reservoir plates of 2,130 pouuds, ⅛ inch thick; bridge plates of 2,100 pounds, 50 feet by 3.28; locomotive plates of 2,300 pounds, 13¼ feet by 6.23; large sheet-iron tinned, galvanized and leaded; cast steel plates 17 feet by 5.57; iron ropes, steel and iron rsils broken to see the the texture of the broken fibrons face. In Krupp's Pavillion is a block of cast steel 5,787 tons in weight; 12 guns, the lsrgest weighing 40 tous, the gun alone is 21.97 feet long, has a calibre 0.572 feet, takes a charge of 132 pounds of prismatic powder, and a loaded shell of 652½ pounds. This gun is made of cast steel. Krupp's works produced in 1872 over 125,000 tons of cast steel.

Besides the Montan industrial expositiou, occupying five large huildiugs, there is the metal industry of all nations in their respective departments, largely exhibited, but of such a multifarious character and extent that it would tske volumes to describe. The English artillery and Pancer pavillon show two enormous pancer plates of wrought irou, made in the Cyclops works at Sheffield. One of them is a masterpiece, 10 inches thick, the whole so homogeneous that not a needle point could find a place in the mass. It weighs 26 tons, has two openings for the guns, and is msde for the German monitor "Borussia." The other plate is 8 inches thick, weighing 12 tous, for some part of the Austrian casemate ship "Custozza." The curve of the plates was effected by hydraulic pressure. Several guns are also exhihited there; one of the largest breech-loading guns is of 9.27 inches calibre, weighing 14½ tons. It is of Armstrong construction, with Krupp Broadwell breech-loading arrangement. The charge is 42 pouuds of prismatic poweder, the projectile 300 pounds. Two mitrailleuses are also shown, of 0.65 inch calibre, as manufactured for the English naval department, with self-acting and variable horizontal movement tor spreading the fire.

Paper.

In the Rotunda of the industrial palace there is in a large drum a sheet of paper, 17,177 meters or 56,440 feet long—equal to two and a qnarter German miles—and 7 feet wide, from Schlogol's mill, Austria. Dr. Rudel states that there are 3,000 paper factories in Europe of which only five per cent. in average were represented iu the London, Paris and Vienna Expositions. From Russia, with 112 paper factories, producing 37,478 tons, at present are only 8 exhibitors. From England, with 369 factories, producing 198,414 tons of paper, are five exhibitors. From France, with 634 factories, producing 165,345 tous, are five; from Holland, Norway, Sweedeu, Switzerland and Spain is ono oxhibitor of each. The other States, oven the United States of America, with 570 factories aud a productiou of 184,879 tons of paper, are not represeuted at all, in this highly important branch of progressive industry. Germany, with 600 factories, producing 198,414 tons, has 37; and Austro-Hungary, with 214 factories and a production of only 8,818 tons, shows 37 exhibitors.

The German Exhibitors have displayed all sorts of psper in use, from the ordinary straw packiug-paper to the finest letter paper, even cigarette paper is not forgotten. The fiue paper made out of pure, chemically prepared wood fibre is new, and the middle sorts of printing and writing paper show that the addition of rsg stuff decreases more and more.

The Austrian paper exhibition is very perfect aud stands in respect to fineness aud elegance, equal to the best sorts of other countries. Although there is plenty of rag stuff ss yet in the Empire, the factories are usiug advantageously the wood fibre of a kind of cotton tree and some sorts of white pine, besides the straw, in the fabrication of paper; lately also, the bark of the mulberry tree, of which, without sny other admixture, an excellent sort of cigarette paper is made. Also potato stems are used for the fabricstion of emballage and packing paper.

The French paper excels iu neatness snd elegsnce. Splendid drawing paper is exhibited here and a great many other choice sorts. The English papers show the same degree of perfection.

The westher continues dry and agreeahle, but it is a little too warm, and the ice machines in the exhibition are in full blast every day. The largest, producing 500 lbs of ice per hour, is from Kropf's factory at Nordhausen, constructed ou the principle of evaporation of ammonia by heat. This machine weighs 260 centals and cost $4,320. The largest machines of Kropf's fsctory make 1,000 lbs of ice au hour. An English machine also produces ice, by evaporation of ether.

Vienna, July 26. G. K.

Notes of Travel in White Pine County, Nevada.---Continued.

[By Our Traveling Correspondent.]

Minnie-Minora Mine,

They have 75 tons of very fine ore that wil average $80 per ton, some of it runniug as high as $120. A year ago, and once or twice since, the company attempted to smelt their ores, but after a very short run had to close up. They have a very fine furnace and are about to start it again on smeltiug ores, about 2,000 tons of which they have ou the dump at the furuace. Most of the ore is free milling. Mr. Ogden has advised the company to erect a 20 etamp mill, and the probability is that his request will soou be granted. There are besides some

Prominent Mines.

The property of S. Brannau of Calistoga, Cal., and G. W. Lamh, of Mineral City, Nev. The Calistoga is developed by a vertical shaft 60 fset deep; 100 tons of free milling ore on the dump. The Mineral City is developed by sn incline down 50 feet; milling ore, 20 tons ou dumps. The Lamb has a vertical shaft down 35 feet; smelting ore, 50 tous on the dump. The Badlam mine has a vertical shaft down 45 feet; smelting ore, 50 tous on the dump. Next in order, going west, aud also west of Mineral City, is the Cliff mine; shaft is sunk on this miue 20 feet; it is smelting ore, 100 tons on the dump. Next is the Hick; shaft down ou this location 20 feet; 30 tous of smeltiug ore on the dump. Next adjoining, still going west, is the Manhattan mine; an incline is suuk on this mine 35 feet deep, and there are 15 tons of smelting ore on the dump.

The ssme gentlemen own some twenty other locations, more or less developed, but in the absence of facts, I must pass them at this time. The metals contained in the ores of the above mentioned mines, are free milling gold and silver, the gold predominating, with a trace of iron, copper and lead, and those marked smelting ores contain about $60 in gold and silver per ton, run 30 per cent. lead, and 15 per cent. iron with a trace of copper. Assays run as high as $400 per ton in gold and silver from the above locations, hut will average $60 for all the ore at present on the dumps,

Hayes G. and S. M. Co.

This is a San Francisco incorporation. Thos. Cahill, Esq., is the Superintendent. Through his politeness I was shown through this company's mine, which is located 1½ miles west of Mineral City. The location of 1,000 feet is covered by U. S. pateut. It ruus east and west and pitches to the south at au angle of about 72°, between regularly defined walls, lined with a seam of clay. The country rock of the foot wall is quartzite and that of the hauging wall, porphyry.

The ore is free milling, containing about equal proportions of gold and silver, a little iron, with a trace of copper. The present development in this mine consists of one main shaft, sunk near the center of their location, to a depth of 137 feet. Following the dip of the ledge, at a point 109 feet down this incline, a level is run east ahout 195 feet, and west 80 feet. A winze is sunk in thie east drift, at a poiut 118 feet from the main shaft, to a depth of 19 feet, at the bottom of which the ledge is 5 feet thick. The ore takeu out at this point will mill $80 per tou; the vertical distance from this point to the surface is 160 feet. At the end of the west drift an air shaft is eunk to the depth of 84 feet. Thie west drift is not run exactly on the ore body, hut a cross drift run to the north fiuds the same ore body at a distance of 20 feet, the width of which from the surface to the depth developed, varies from 5 to 8 feet. This ore will sverage $70 per ton. About 400 tons are now on the company's dumps. They are now employing 8 men. The general prospect of this mine for extent and permanency is excellent, snd has been pronounced hy prominent experts, second to none iu Eastern Nevsda.

The Mitten Mine.

The south extension of the Katie ledge is located about 4 miles southwest from the Hayes mine. This location runs north and south and dips to the west; the ore is free milling, carrying silver and gold in about equal quantities, with a trsce of lesd; assays show it to contain $30 in gold, $44 in silver. This property belongs to D. S. O'Brien and B. Mitten. It is only slightly developed, but sufficiently to prove it to he of value. A shsft 10 feet deep and an open cut 20 feet long, constitute the present workings. These gentlemen own some six other locstions in the district, all of more or less value and somewhat developed. About two miles southeast of the Mitten, on another entirely different ore belt, is located the

Miami Copper and Silver Mine.

The company own 1500 feet in their location, which runs north and south, snd dips to the west; the foot wall is porphyry, covered with a black gangue; the hsnging wall is ss yet imperfectly defined. At a depth of 65 feet they have a ledge 5 feet thick of the black oxide of copper. There are about 65 tons of this ore now on the company's dumps, that assay from 40 to 60 per cent. copper. In sinking their shaft, near the surface they took out a red oxide, 10 tons of which were sent to your city for reduction. It netted the proprietors 60 per cent. Messrs. Fred. Woods, H. M. Cox and Joseph Crank are the lucky owners. Passing to the uorth ou this ssme ore helt, the first extension is the

Burnside Copper Mine,

Owned by Messrs. Wagner, Degroff & Ellmore, containiug 1500 feet similar in character to the others, and developed to a depth of 60 feet, by an incline shaft following the dip of the ledge. They have a body of ore, about 4 feet thick, that will average 40 per cent., runuing from 22 to 60 per ceut. About 20 tons of ore are on their dump. Another location still north, known as the Copper Miue, is worthy of mention, aud considerably developed.

The Defiance Mine,

Owued hy John Ragsdale & Co., is located one-half mile southwest of the Hayes mine, but on a different ore hody, from that on either of the above mentioned miues. There are 15,000 feet in this location, developed by a shaft, about 50 feet deep, which shows a ledge 8 feet thick; they hsve now on their dump 125 tons, smeltiug ore. The Canton M. Co., paid $12 per tou for this ore on the dump at the mine. South of the Defiance, is a location of 800 feet, cslled the Ashland; it is owned by the same parties, and prospects well.

Watson Mining Co.,

Incorporated in San Francisco last May. Mr. D. T. Ellmore is Superintendent. The company own two mines, one the extension of the Hayes mine, and known as the Watson; the other is called the Katie, located about three miles west of the Hayes, and on an entirely different ledge, which runs northeast aud southwest, snd dips to the northwest, at an angle of ahout 65° This location contains 1,500 feet on the ore hody. The rock is free milling from the top, down. By way of side note I would state that this district has been and is now kuown as a hase metal range. While there is plenty of hsse metal to run a hslf dozen furnaces here, nearly all the miues of this district that were originally considered base, proved to be of free milling ores, after going down from 40 to 60 feet; aud a number of them have proved to be such from the surface. The development of the

Katie Mine

Consists of two incline shafts, suuk to depths of 14 feet and 75 feet. The last mentioned is located uear the center of the mine. Iu this shaft the ledge shows 20 feet between the walls, of which the hanging wall is porphyry, and the foot wall quartzite. The ore from this mine will mill $50 per ton on an average; some taken from their main shaft runs into the thousands. There are about 100 tons of ore now ou this company's dumps. They are now working six men at their mine, aud some 16 others are engaged in putting up a 10-stamp mill, located just below Mineral City; this mill will have power for 20 stamps, and is expected to be completed in Augus:. It will have the capacity to reduce 20 tons of ore daily. All the usual appliances around a quartz mill will he brought into requisitiou here. This company, hy its enterprise, has so stimulated this district that it is likely to rival any in Eastern Nevada. L. P. Mc.

COLORADO SCHOOL OF MINES.—Three years ago the Colorado Legislature appropriated nearly $4,000 for the erection of a brick building to be used for a School of Mines. This sum proved ineuffieient, and Bishop Randall, feeliug the necessity aud importanco of such a school, began tho work of fitting up the iustitution, finishing the interior, and funishing the necessary apparatus. The scrvicoe of Prof. Mallet have been secured, aud be has already entered upon his duties; other teachers and lecturers have been engaged, and on the first Wednesday in September the Department of Physics will he opeued and fnlly organized for work.

How are the Deep Placer Mines of Plumas County to be Rendered Productive?

The above question is one of importance and demands the serious consideratiou of every prscticsl miner in this county, and not only of every miner, but also of every farmer and mechanic, for it is a fact patent to every ordinary observer that to a certain extent the latter are dependent upon the former. In what respect dependent? They, the miners, are the consumers of the product of the farmer, and should the mines not yield so well ss formerly, or cease to be worked on so large a scale, the results would most disastrous to the agricultursl interests of this county. One more point remains to be noticed, and thst is that nearly all the shsllow placers, ravines snd flats on which water could be conveyed, are worked out. The consequences are obvious. Miners must turn their attention to the deep placers of this couuty, in the opening and working of which capital must be employed. At the present time many old miners believe thst the "Blue Lead," celebrated for its richness, extonds through this county, south of Clermont Hill. In fact, a mining expert asserts that he can trace the channel through from Moore's Flat, Minnesota, Clipp's Flat, Alleghany, Forest City, Goodyear's Bar, Monte Christo, Port Wine, St. Louis, Howland Flat, Gibsonville, Whiskey Diggiugs, Onion Valley and Sawpit Flat to Feather river. And have we lost all traces of it at this point? By no means, and we are becoming more convinced than ever that tlhis same channel continues through this country south of Clermont Hill. Judging from the topography of the couutry and the natural indications presented, the character of the surface formation, and nature of the bsd-rock wherever found, we may he warranted in the asscrtion that this same chsnnel (if it be one) was formed during the pliocene or sub-cretaceous era. We are fully aware of the fact that the same characteristics exist in the bed rock reached by Myers & Siler on Clermont Hill as exist in the Blue Lead at Forest City, Sierra county. The bed-rock is a soft, friahle shale or slate, either white or blue, and in the crevices and pot-holes of which remsins of plants and animals are sometimes found in a fair state of preservation. Again, the out-croppings of the rim-rock are plainly visihle and easily tracod all along this rich chsnnel, and here we may observe in passing, that the indications presented on the ridge east of Quincy point to the existence of auriferous dsposits in that direction. Aud why? Simply because all the gulches and rsvines in this ridge have paid well for working in former years. From this we may conclude that a basin or channel exists in this direction, extending from Argentine by way of Squirre Creek, through above Mill Creek, and falling or emptying into the Blue Lead channel, at or near Clermont Hill.

And now how are these mines to be rendered productive? Is it necesssry thst the attention of capitalists should be drawn in this direction? Or must we wait for some Crœsus from Sau Francisco to prospect and open up this ground? We will try and answer these questions in one sentence—let the miners of this county organize companies of say twenty members, and let them incorporate, levy an assessment of say $20 per interest to start with, and then sink a shaft to bed-rock; should they strike pay they can then run a tnnnel on au easy grade to the shaft, and by this means supply the mine with good air. From this point the mine will be easily opened and prospected. Thus while the expenses will be scarcely felt, by any iudividual member of the company, claims can be opened and rendered productive which otherwise must remain forever nudiscovered and unopened. In Sierra county, this system is adopted aud carried out with good results—witness the Bald Mountain mine at Forcst City. The lucks shareholders to-day are worth probably $30,000 each, who three years ago were working for wages in the mines. Here is an incentive to exertiou. Let us not hear the miners of Plumas Co. complaining of hard times, when all that is necessary to render this county the "Banner mining county of the State" is a little energy, exertion perseverence and capital. That such mines exist we do not for a moment doubt, and that those auriferous deposits will ere long be opened up and rendered productive, is equally certain. It remains to he seen whether the miners of this county will sit with folded hands and let foreign capitalists come in and reap the golden harvest.—*Cor. Plumas National.*

THE SALT LAKE *Tribune* states that the Camp Floyd mill is about to start up. The custom ore already on hand and being hauled amonnts to about 800 tons. Half of this quantity is supplied by the Sunuyside, on Lion Hill. The Lion mine and several others furnish the balance. Mr. E. N. Riotte has heen inspecting most of the mines in the vicinity and contracting for ores for the mill. Last week Mr. Riotte visited Butterfield Cañon, and the coming week he will he in Tintic. On his return to Salt Lake and before his departure for San Francisco, Mr. Riotte will spend a few days inspecting several mines on the Wahsatch rango and in Parley's Park. In this latter camp ho hae beon requested to report for some San Francisco capitalists, and, if satisfactory, some sales will be effected.

Scientific Progress.

Chloral Hydrate.

Such widely varying opinions have been promulgated concerning the effects of chloral, that nny definite information, resulting from critical and experimental investigation, becomes highly interesting. From the report of the Academy of Sciences in Paris are gleaned the following facts in regard to the prize essay of M. Personne on chloral—a therapeutical agent recently introduced into medical practice, and likely to prove of great service in the healing art, as it has the precious property of producing sleep when taken into the system, and thus, for a time, alleviating pain. Chloral has been known since 1832, when M. Liebig discovered it, in studying the action of chlorine on alcohol. But till lately it had not been turned to any practical use. It was the remarkable physiological action of chloroform, and its similarity of composition to chloral, that called the attention of chemists and physiologists anew to the latter compound.

M. Dumas showed, some time ago, that hydrate of chloral, when brought into contact with alkalies and alkaline carbonates, was transformed into chloroform and formic acid. The question then arose, might not a similar change take place in it when introduced into the animal system, through action of alkalies in the blood, and thus chloroform be produced in the organs into which it entered? Guided by such theory, M. Oscar Liebreich admiuistered hydrate of chloral to some of the lower animals and to man. The physiological effects, similar, in some measure, to those produced by chloroform, seemed to favor the theory; still, the result obtained in these earlier experiments (which were repeated by other observers) did not always conform to expectation. Certain experiments, differing from M. Liebreich's view, asserted that the action of chloral was one proper to itself, and quite independent of chloroform. To reach a satisfactory conclusion, it was necessary, first of all, to be assured of the purity and identity of composition of the products employed in separate experiments; and M. Personne was not long in convincing himself that the products employed, under the name of chloral, varied much in degree of purity and composition. He formulated a process of preparation, which furnished a hydrate of chloral always the same. Thus equipped, he was in a position to attack the problem in question—Is hydrate of chloral really transformed in the system, so as to produce chloroform conformably to chemical theory?

Now, there were some very legitimate doubts as to such action. Some experimenters, as we have said, denied that the effects observed were due to chloroform. Animal blood, submitted to the action of hydrate of chloral, did not give any odor of chloroform; whereas this odor may be easily recognized where chloroform has been used in the same way. More than that, if hydrate of chloral be added to blood which is newly taken from a vein, and kept in circumstances the most favorable, according to theory, for production of chloroform, still no odor of chloroform is observed. A decisive experiment was, therefore, necessary. Was it demonstrable that, notwithstanding the contrary appearances, chloroform was actually formed in the system after ingestion of chloral? M. Personne proceeded as follows: He gave a dog (which was in good condition) eight grammes of chloral. When the state of anæsthesia was nearly complete, he took from the jugular vein of the animal a quantity of blood, in which to search for the presence of chloroform. The process he then adopted, and which we cannot here give in detail, consisted in passing a current of air through the blood (which was kept at a temperature of about 40° C.), and then through a red-hot tube, the further extremity of which was immersed in a solution of nitrate of silver. By this means chloroform contained in the blood would be withdrawn, and then decomposed by the heat, and the products of this decomposition, passing into the nitrate of silver, would cause a precipitate of chloride of silver (through chlorine from the decomposed chloroform).

This experiment, repeated under varying conditions, always gave a positive result, proving the presence of chloroform in the blood of dogs submitted to the action of chloral. Operating similarly with blood to which hydrate of chloral has been directly added, M. Personne proved that chloroform was produced in it also. If the odor of the chloroform in these cases did not become perceptible, the reason was that, being feeble, it was masked by the odor proper to blood itself.

Ingenious Engineering.—During the construction of the bridge at Kuilenborg, Holland, says the *Chronique de l' Industrie*, one of the principal traverses, some 465 feet in length, was placed about one inch too far on the piles. This error was rectified in a very ingenious manner. The expansion of the mass of metal was exactly ·0394 inches per Fahrenheit degree. At the locality of the work the difference between the temperature of the atmosphere by day and by night was 25° F. In the morning the too far advanced end of the traverse was securely bolted down, when during the day the heat of the sun expanded the metal so that the free extremity advanced ·985 of an inch. Then at night the latter end was fastened, and the contraction caused a like movement of the opposite free extremity. This operation, twice repeated, brought the traverse into its proper position.

How the Duration of a Flash of Lightning is Measured.

Scientific men assert that a flash of lightning does not endure for more than the millionth part of a second. How did they find this out? Obviously, not by any ordinary means, for such small portions of time are utterly beyond the cognizance of our senses, and even of our thoughts. Watches which mark quarter seconds are not uncommon. We have seen men try to count the beats of such a watch, and it is but rarely that we have met any one who could succeed. Not only could they not count them aloud, but they could not even *think* of the number so as to keep a record of them in their minds. How, then, was it possible to measure a portion of time so much less in quantity?

Almost every boy has whirled a fiery brand in the air so as to make a "round robin." How does it happen that such a moving *point* seems to make a fiery circle in the air? In this way: an impression made upon our sense of sight can not be instantaneously removed. It lasts for about one-eighth of a second. Hence, if the moving point completes the circuit in less than the eighth of a second, it will make a new impression before the old one has expired; the path which it describes will be constantly visible, and the circle will appear complete. In the same way, if a wheel with many spokes be caused to revolve rapidly, the spokes become invisible and the wheel appears solid. But if the wheel were illuminated by a flash which did not last long enough for one spoke to take the place of another, the spoke would be visible, and the wheel would appear at rest.

A few years ago we saw such an experiment tried in Rochester, N. Y. The lecturer had a wheel, which was painted white, and on the white ground was painted a number of red rays. When whirled with a very moderate velocity, the wheel appeared of a dim, pinkish hue. If, while thus revolving, it were illuminated by a flash from burning gunpowder, the spokes would not be visible, the flash of even the best gunpowder lasting longer than the time required for one spoke to take the place of another. But when, instead of gunpowder, fulminating mercury was used, the spokes were visible and the wheel appeared to stand still, so much more rapidly than gunpowder does fulminating mercury explode.

By driving the wheel a little faster, the flash from the fulminate failed to show the individual spokes; showing that even the flash from fulminating mercury lasted long enough to allow each spoke to move into the place of its predecessor before the impression made by the latter had faded from the retina.

A Leyden jar was now charged and discharged before the revolving wheel, and then the latter could not be driven so fast that the spokes would not be visible and the wheel appear to stand still. Now, if we knew the velocity of the wheel and the number of the spokes, it would be easy to tell the time required for one spoke to take the place of another. Suppose the wheel had 100 spokes, and moved at the rate of 1,000 revolutions per second; it is obvious that if the individual spokes be seen, the duration of the flash must be less than the one hundred thousandth part of a second.

Such is a rude outline of the method by which the duration of a flash of lightning is measured. Of course, the apparatus used in determining this duration is much more delicate than that which we have described, and which was used merely for illustration before a large audience. But the general principle is the same, and in this way it was determined that the duration of a flash of lightning is less than a millionth part of a second. Hence a carriage wheel in rapid motion, seen at night by means of a flash of lightning, appears at rest. The swiftest race-horse would not have time to make a perceptible movement of a muscle, but would appear as if carved in some inanimate material; and even the swiftest locomotive and its train would appear as if some icy hand had been laid on its energies.

That a flash of lightning endures for a certain period there can be no doubt, but this period, when compared with the duration of any mechanical operation, is infinitely small. Stand beside a target at which the bullets are being fired from a distance of say 200 yards, and first you will see the flash, after a short interval you will hear the *thud* of the bullet, and finally you will hear the report of the gun. In this case, you might see the flash, and afterwards be shot by the bullet. Indeed, so much time elapses between the flash and the arrival of the bullet, from a distance of 250 yards, that it would be impossible to hit an active man, at that distance, if there was a cover to which he could spring when he saw the gun discharged.

How different with lightning! There the flash and the stroke are simultaneous. If we see the flash we are safe. He that is killed by lightning never hears the thunder.—*Technologist.*

Oxygen as a Commercial Product.—A company has been formed at Buffalo to supply oxygen and hydrogen to consumers. It is founded on Tessie du Mothay's process, which has already been described in a former issue of this journal. The material employed by the company is styled manganate of soda, though whether its composition is chemically identical with that body is questionable. The so-called manganate is crushed to a coarse powder, and is then placed in elliptical retorts, seven feet long, one foot wide and two feet deep. These are placed horizontally, the ellipse being vertical. A current of superheated steam is then passed through the mass, at first slowly, afterward more rapidly; when the heat has become sufficiently high, part of the oxygen is eliminated, and passes off with the steam, which latter, being condensed oxygen, remains in a state of tolerable purity. The condensers used are similar to those employed in gas works to separate the less volatile constituents from the coal gas. They are simply a system of upright cast iron U pipes inverted. The water thus formed is sufficient in quantity to wash all soluble impurities from the gas. Farther impurities are removed in a scrubber, whence the oxygen passes, fit for use, into the glass holder. After the manganate of soda has been subject to the action of the steam for about ten minutes, the current is shut off and atmospheric air blown in its place, the effect of which is to reoxidise so much of the soda-salt as has parted with its oxygen. The nitrogen of the air escapes. After ten minutes the air is cut off and steam re-introduced, which, as before, carries with it oxygen into the condensers. Many difficulties have been found in working this process. Theoretically the manganate should continue to yield oxygen *ad infinitum;* but in practice it is found that after being some time in use it loses its porosity, and, consequently, does not permit the steam to act through its whole mass. It becomes, therefore, necessary to recharge the retorts after not very long intervals. It is believed that, if the steam could be kept perfectly dry throughout the process, a result much more nearly approaching that predicted by theory would be attained. —*Iron Age.*

Mechanical Progress.

Krupp's Guns.

Every one has heard of the famous Krupp rifled steel cannon, which caused such a sensation at the Paris Exposition, and so much more when directed against perhaps the same admiring crowds a short time afterwards. But few, if any, have an adequate conception of the immensity of the works where come these terrible monsters. The cast steel works at Essen, on the Rhine, have been in operation since the year 1810. They cover 988 acres, of which 185 acres are roofed over. 12,000 workmen are constantly employed, engaged directly in working the steel. Besides there are some 2,000 men employed in building and repairing, 5,000 in the mines and furnaces connected with the works, and 739 clerks and other employés. The total is thus brought up to nearly 18,000 men. In 1872, the amount of cast steel produced was 123,315 tons, consisting of axles, tires, wheels, rails and railcrossings, springs, cranked axles for marine engines, boiler-plate rolls, spring steel, tool steel, guns, gun carriages, shells, etc. There are 1,090 furnaces of different kinds, smelting, reheating, heating, puddling, cupola, etc., 264 forges, 275 coke ovens, and 310 steam boilers. There are 71 steam hammers and 286 engines in the works; the total horse-power of the engines being about 10,000. There are 1,056 machine tools.

During the year 1872, 491,535 tons of coal and 123,315 tons of coke were consumed. Water for the boilers, etc., was used to the amount of 7,700,000,000 gallons; and the gas, made on the spot, reached a total of 176,000,000 cubic feet. Between the shops are twenty-three miles of broad, and nine and three-quarter miles of narrow road, railway racks, with full appointments of rolling stocks. Besides these means of communication, 272 carts are employed. But to go further into this maze of overwhelming figures would be to no purpose. Suffice it to say, that the establishment is in reality a small city. It has its own stores, dwellings, educational buildings and hospital. Whether we consider the vast amount of crude materials, ores, metal, fuels, etc., entering its gates, or the ponderous castings and the varied manufactures leaving the works, the effect on the mind is completely overpowering. And the quality and beauty of the finished products are commensurate with their quantitative importance. Altogether the Essen steel works of Friedrich Krupp present a sublime spectacle of vastness combined with perfect engineering economy.

Among recently invented military arms is the Hotchkiss revolver cannon. Tests made on it at Satory, France, show that a gun with a caliber of four centimeters is capable of being fired at the rate of sixty shots a minute, which gives seventy pounds of cast iron thrown during that time. The projectile intended to be used is a percussion shell. If the published reports are at all accurate, this new weapon bids fair to exercise an important influence on the art of war.

Testing the Quality of Iron.

Mr. Von Ruth, an inspector of mines in Holland, has discovered a method of taking an impression of iron so as to show accurately the fiber of the iron, and thus afford a means of comparing and distinguishing different qualities of iron. The piece of iron to be tested is smoothly polished, and the surface thus prepared is then acted upon by muriatic acid, until all the particles of slag have been dissolved out. The time required for this varies from six to twenty-four hours, according to the strength and temperature. Since, according to this inventor, the slag is more rapidly attacked than the iron, the fibers are left in relief, and from the etched plate thus prepared, a print can be made, with printing ink or India ink, so as to exhibit clearly and distinctly the very fiber of the iron. When bundles or piles are made for rails, or different sorts of iron are rolled together, this furnishes a quick and simple method for ascertaining the direction of these fibers. As a means of investigating the changes in the sinewy texture of iron near where it has been welded, this method is claimed to be valuable.—*Am. Artisan.*

Granulated Iron for the Danks Puddler. The granulation of the metal was effected by the same machine employed in granulating slag, and illustrated in *The Iron Age* of May 1. The object and advantages are these: One of the greatest drawbacks to the success of the Danks puddler has been the cost of melting the iron when the charge consists of pigs. The pigs are charged on, say 1 ton at a time, and lay like a dead mass upon the bottom, impenetrable to the heat. These cannot without difficulty be turned over without damaging the lining of the furnace, and also containing a large quantity of silica, the damage to the fettling and puddling process is very great. To overcome this, cupolas have been erected for supplying the Danks with *molten* iron; but this is expensive, in addition to the inconvenience of having molten iron moving about the works. This granulated iron, made by running the iron direct from the blast furnace by Mr. Wood's system will, it is hoped, overcome all the difficulties, and also supply a better quality of iron, free from silica, and enable the puddling machine to rotate as soon as charged, and thus expose the whole surface of the iron to heat, while the metal, being in such small pieces, will melt in a very short time. Mr. Danks, who has seen the iron produced, quite approves of the system, and believes it will effect a saving of six to eight shillings per ton.

A Dresden engineer proposes a method for increasing the durability of railroad ties, by which, he considers, they may be made to last four times as long as at present. The sleepers, of whatever kind of wood, are first allowed to dry for some time in air, then artificially dried in a hot chamber. They are next introduced, while hot, into an impregnation apparatus containing heated coal tar, where they are impregnated thoroughly under pressure. Then they are coated with sifted sand or coal ashes and allowed to dry. Every fissure is carefully filled; the nails used in fixing the sleepers are first dipped into hot coal tar, and any part of the work which may be exposed is carefully coated. The inventor further states that wood thus prepared has been also used for house building purposes, and with excellent results.

Canals in Egypt.—The annual volume, "Statistique de l'Egypte," which has just been issued by the Minister of the Interior, shows that there are in Egypt one hundred and thirteen navigable canals and seven hundred and fifty-six smaller ones for purposes of irrigation, and, in addition to 107,000 sakiehs, shadouts and other ancient modes of raising water, there are at work in Upper and Lower Egypt nearly five hundred steam pumps. Ten years ago the value of the exports was under three millions sterling; they now amount to twelve millions sterling. Important results are anticipated from the projected Soudan Railway. The Soudan is described as capable of producing in large quantities grain, sugar and cotton.

Tidal Power Machine.—A practical trial recently took place in Brooklyn of Edward W. Morton's machine, worked by the rise and fall of the tide, the power thus derived to be utilized for mechanical purposes. The contrivance was tried at the foot of South Tenth Street, East River, before a large number of persons interested. The machine works by means of a "float," which, as it rises and falls with the waves of the tide, propels the machinery to which it may be attached. At the trial it was geared to a saw, and worked with the full rapidity of a circular-saw run by steam-power, although, perhaps, not quite so uniformly.—*Ex.*

Turkish Ironclads.—The Turkish government has four ironclad frigates of 900 horse-power and 16 guns each; one frigate of 750 horse-power and eight guns; seven corvettes carrying four or five guns each, and two monitors of four 150-pounders each. Several other ironclad war vessels are in course of construction.

Peat charcoal has been used in marine engines with satisfactory results. This form of fuel is quite as compact and much more cleanly than coal, and for many purposes will no doubt supersede it.

Our Weekly Stock Review.

THURSDAY EVE., Aug 28, 1873.

The Mining Share Market, during the past week, has shown no more animation than it has for a month or so past. Everything is down to hed-rock prices; hut that seems no inducement to huyers to come into the market. There is no discouraging news from the mines to create the depression, and hoth dividend and non-dividend paying mines share the same fate in the market. So large a proportion of the community is interested in politics, just now, that there is little hope of much attention being paid to stocks until after Election-day has gone by. Our "Mining Summary" will give a good idea of the state of the prominent mines on the Coast, the information being carefully collated from journals publised in proximity to the mines mentioned.

Dividends paid this month by mining companies called on the Stock Board, amount to $1,270,000. They were paid hy the Belcher, Crown Point, Eureka, Eureka Consolidated, Golden Chariot, K. K. Consolidated and Minnesota. The following assessments were delinquent this month, amounting in the aggregate to $580,850:

Name.	Per Share.	Amount.
American Flat	$ 50	$15,000
Buckeye	1 00	16,000
Caledonia	2 00	40,000
Caroline	20	6,000
Carson Consolidated	10	5,000
Charter Oak	25	7,500
Cherokee Flat B Gravel	5	2,500
Empire (Idaho)	3 00	75,000
Globe	76	16,000
Golden Eagle	10	3,000
Hale & Norcross	5 00	80,000
Ida Elmore	1 50	16,000
Knickerbocker	1 00	24,000
Old Providence	10	3,000
Savage	5 00	80,000
St. Lawreuce Mill	I 00	20,000
Succor Mill	75	17,100
Summit	26	7,600
Tyler	25	8,250
Woodville	75	21,000
Yellow Jacket	5 00	120,000

The following ie a statement of the assessments and dividends thus far this year.

	—Assessments.—		—Dividends—	
	No.	Amount.	No.	Amount.
January	24	$650,050	7	$573,181
February	30	686,000	7	849,000
March	36	681,960	5	811,000
April	18	388,860	4	1,090,000
May	20	616,900	3	1,872,000
June	22	430,600	8	2,232,000
July	35	742,700	7	1,389,500
August	21	680,850	7	1,270,500
	206	$4,677,810	48	$10,087,181

This showing is a good one, as it proves stockholders to be $6,400,000 ahead. Still the mistake should not he made of supposing that these mines are the only ones paying dividends, for they are only those called on the Stock Board. Many and many a good mine is being worked in this State, which pays handsome dividends to its owners and which is never heard of, except by those directly interested.

MINING SUMMARY.

THE following ie mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

MILL RUNNING.—Alpine *Chronicle*, August 16: The quariz mill of the Exchequer Company commenced active operations on Monday last. As all the machinery le new it does not do ae well as it probably will after it has heen running a couple of weeks. The bullion of the ore now being worked is of extraordinary fineness—965. Last week we menioned that the Exchequer Company had struck their ledge. They are now drifting on it, expecting to find a hody of good ore.

DEL NORTE COUNTY.

HAPPY CAMP.—Crescent City *Courier*.—The mine consists of 300 acres of good mineral land, running from the working point toward the town of Happy Camp; it is supplied with an abundance of matter from the South Fork of Indian Creek. This Co. are using a 4-in. hydraulic nozzle pipe, with a pressure of 180 ft. and working their extensive mines with a force of 9 men, exclusive of the Superintendent, J. R. Brett, and are taking out at lesst $100 per day. Owing to the dry season and the seepage in the Co.'s ditch, the Superintendent intends to suspend operations for a few monthe.

Lane. Rowland & Co. have located some new ground, situatcd on or near Clear Creek, in close proximity to the Klamath River. This new ground prospects rich in gold, and all that is needed is a few thousand dollare to open it for profitable working, the water being about 3 miles from this ground.

MARIPOSA COUNTY.

DOZIER MINE.—Mariposa *Gazette*: The location of the supposed mine is near the head of Drunken Gulch, about four miles from Bear valley—between the Mt. Bulliou Ridge and junction of Sherlock's creek and the Merced river. The formation is favorable for silver—so say those who know something of this kind of mining. The discovery was made by Dr. Dozier and W. L. Campbell. But little work has been done as yet. The vein, at the depth of 6 ft., is about 18 in. in thickness.

NEVADA COUNTY.

EUREKA MINE.—Grass Valley *Union*, Aug. 21: The Superintendent of the Eureka (Grass Valley) mine under date of August 16th, writes to the Trustees at San Francisco, as follows: "Owing to the scarcity of water, our running time for this week has been only four and a half days run with fifteen stamps. Our clean-up for the time is 1,110 ounces of amalgam. The bottom level esst cross-cut ie in 41 ft. We are still driving through the horse. No ledge or well in sight yet. The sixth level stopes look about the eame as last Saturday. We have commenced to sink a winze from the hottom of the sixth level, about 60 ft. west of the Idaho line. We have a good ledge to commence with. No other changes."

SUTTER COUNTY.

PHŒNIX MINE.—Sutter *Independent*, August 20: Workmen are now engaged on the 700-ft. level in this mine and have a body of ore nearly 60 ft. wide, with every indication of increaeing as they descend upon it. The foot and hanging walls are well defined and the rock is very easily managed.

THE ALPINE MINE.—Work on this mine, which is located at Plymouth, is progessing finely. A fine body of ore is being extracted and worked. The future of the Alpine looks very flattering, and we shall be glad to record a rich return from the mighty batteries that crush out the precious gold.

LINCOLN MINE.—A spleudid body of ore has been

struck in this mine, and the present Superintendent is sanguine that it will last for years to come. The clean-up made last week went far above the figures of the previous one. We hear it stated that the company intend to effect a fine 60 or 80-stamp mill on the site of the present one, this fall.

NEW SHAFT.—The Superintendent of the Kennedy mine, near Jackson, is about to tear down and remove the old hoisting works above the road to a new location, and prepare to sink a new shaft. The Kennedy is fast becoming one of the paying mines of the county.

Nevada.

BRISTOL DISTRICT.

SULTAN.—The vein in the bottom of the shaft is all ore, and is evidently improving in quality, as recent assays show. Two or three days ago some very beautiful specimens were extracted from this mine. We were shown one by Mr. Sultan yesterday. It resembled a bowl of chalcedony, perhaps 10 inches across, and filled with glittering ore.

CAVE.—Nothing new to note this week. The winze is being steadily sunk, and the tunnel run toward the point of intersection. Taking out the usual amount of ore, and working the same number of hands as at date of our last report.

CORNUCOPIA DISTRICT.

PLENTY IN A HORN.—Eureka *Sentinel*, Aug. 19: A private letter from A. McDonald, a mining expert, contains the following:

"I have examined the district and do not like it. They have a little ore on top of the ground, which, if assorted close, might mill $150 per ton. The section in which the quartz is found is very limited, and if there are ledges at all they run in all conceivable directions. If I owned the whole district I might think it worth while to prospect a little. The newspaper reports are all humbugs. I shall stay here two or three days longer, but do not expect to see anything to cause me to change my mind. People are coming in from all directions in great numbers, but I have not yet met a single mining man who does not entertain views similar to mine. The country around about has been well run over and nothing found yet of any value.

The district lies near the Oyhee River, and is at least thirty miles further from the railroad than represented. No wood nearer than twelve miles, and not even sagebrush for fuel."

PIOCHE DISTRICT.

AMERICAN FLAG.—Pioche *Record*, August 16.—Sinking the shaft rapidly on the vein, which is the full width of the shaft, and showing a fine streak of ore on the foot-wall, with bunches of good ore scattered through the whole of the vein matter. Working three shifts. Also drifting east and west from the seventh station, on the vein, which shows excellently on both drifts, the ore being fully equal in quantity and quality to that in the shaft. Shipped on the 5th inst., by Pritchard's fast freight, 18 bars of bullion, valued at $9,183.65, and yesterday, by Wells, Fargo & Co.'s express, $4,000, making $13,183.65 for the past week. The Company's mill is still running on Newark ore, and working it to a high percentage, as usual, but will shortly be put to work on their ores, when the bullion product will be increased proportionately.

PAGE AND PANCA.—The winze is now 102 ft. deep, below the 360-ft. level, having been sunk 12 ft. during the week. The water continues to prove a great source of annoyance, causing the sides of the winze to cave in many places, and necessitating very thorough timbering as fast as the ground is opened. More ore is showing itself, and the indications altogether are of a favorable character.

INDOMAR.—The face of drift on the 575-ft. level shows a marked improvement over our last report. The vein is larger and the ore of a higher grade. Have taken out more ore last week than for a long time previously. Employing the usual number of men.

CHIEF OF THE HILL.—The main shaft is now down 810 ft. below the level of the Burke tunnel, and sinking goes on night and day. A progress of 25 ft. has been made during the past week in the west drift on the 210-ft. level, with two shifts working. The slopes are looking as well as usual. There are now on the dump 84 tons of ore, and a small quantity is being taken out daily.

HAVANA.—There are now on the dump 40 tons of first-class chloride ore, mixed with a small quantity of base ore, on the dump. The ore at the bottom of the shaft is now the best that has yet been found.

MONTANA.—Have not cut the vein yet on the 173-ft. level. We learn that a new contract has been let this week, which must certainly reach it.

BROOKLYN.—Commenced drifting Friday on the ledge from the bottom of the winze, at the depth of 60 ft. The ledge is 2 ft. wide, of excellent ore — better than they have ever before taken on. We look for something good in the Brooklyn this week.

SILVER PEAK.—A little more ore was taken out last week than the week before. The mine is looking well generally. The workmen are sinking the shaft as fast as possible. The hauling of ore from the mine began on Friday last.

PIOCHE.—No change in the appearance of the mine. The usual number of men are employed, and about the same quantity of ore is being taken out. The ore is now accumulating rapidly on the dump.

MEADOW VALLEY.—The repairing in No. 5 is nearly finished. No. 7 is at work as usual. No developments of importance last week. The new hoisting works of the company will be put to work about the 20th of this month.

RAYMOND & ELY.—Between 60 and 80 tons of ore are taken out and shipped daily. No note of interest to make.

SIERRA DISTRICT.

HUMBOLDT.—*Silver State*, August 21: A quantity of ore from this ledge was recently run through the Krom Concentrator, at Star. A sample of the course concentration showed it to contain $529 87—330 75 in gold and $19,912 in silver. These tests were made by D. Van Lennep, of this place, and are correct. The mine is located near Dun Glen, and is one of the oldest in Sierra District.

ESSEX MILL.—The old Essex mill, formerly located at Dun Glen, has been moved to Unionville, and is now in the hands of mechanics for re-erection. It will be run on Arizona ore.

LOW WATER.—Buena Vista creek is lower than it has been at any time for years, and all the mills are at times obliged to shut down in consequence of the scarcity of water.

SALE.—Ex-Mineralogist White, of this State, went down to Indian District to look at the Eagle mine, Friday last, on which he is to report to a San Francisco company, now negotiating for its purchase for the sum of $10,000. We understand that his report will be favorable, and that the sale is a foregone conclusion.

STAR NEWS.—A two-foot ledge was struck in the American Basin in the early part of the week, and contains a goodly quality and quantity of ore.

Dick Nash is still at work on the Mammoth. The mine is looking well.

The Sheba and De Soto mines, as usual, are sending out daily a number of tons of first-quality ore. The mill is running on ore from the Sheba.

SILVANIA DISTRICT.

THE NEW MINING DISTRICT.—BORAX *Miner*, August 12: We learn from a gentleman just returned from this new mining district, Silvania, that the miners are at work on several ledges containing argentiferous galena, which works on an average about $200 per ton. Silvania is a promising camp, situated 15 miles south Alida Valley, and 4 miles southwest of the old Palmetto mill, and is well supplied with wood and water. The district has only been organized within the last two months. Mr. F. Mausing was elected Recorder, and has since recorded over a dozen rich surface mines. The miners are somewhat retarded in their work, on account of the Alida mill being closed at present. Nevertheless, some of them did not hesitate to bring their rock to Columbus for working, it being packed on a mule train. These parties are well satisfied with returns from the mill.

WHITE PINE DISTRICT.

MONTE CRISTO MILL.—*News*, Aug. 2: Now lying idle. Possesses 20 stamps, 6 pans and 4 settlers, with a newly constructed Stedefelt furnace attached. The water supply is ample, and timber in abundance in close proximity.

TRENCH MINE.—The 200 tons on the dump is about the richest average rock we have ever seen in this or any other district, having worked $300 and $500 to the ton.

The Abchardt & Aurora Company are busily at work on their new mill. The Stanford mill is steadily running and producing most satisfactory results.

Arizona.

CINNABAR.—Arizona *Miner*, Aug. 9: Col. Cauy has discovered a huge deposit of ore, which he, and others, pronounce good cinnabar ore. Specimens of it may be seen at this office.

TIGER DISTRICT.—Mr. Henry M. Herbert, Under-Sheriff of this county, arrived here last week from Tiger and Pine Grove districts, in Bradshaw mountains, with the good news that Messrs. Goodwin & McKinnon had just crushed and cleaned up six tons of War Eagle ore, and that the clean up netted them 35 ounces of gold, worth, at least, $16 per ounce. All of which is decidedly good and cheering.

A shaft was sinking on the California lode.

Jackson & Co's force were taking out ore. Their crushing works were idle. Cause—no water.

The ledge recently found near Prescott by D. Hatz, assays well in gold and silver.

This week has witnessed the departure of several placer miners for the Black Canon country, thirty miles southeast of Prescott, where report says, new and rich diggings have just been found by a party of Lynx creek men.

About the usual number of men—between forty and fifty—are at work on Lynx and Hassayampa creeks. Another rain, such as the recent one, would start several sluices.

The Governor visited Smith's mill, below Wickenburg, and reports the mill most admirably arranged and successfully reducing ores from the Vulture lode. The mill has been in operation about two months, and at the rate the ore has paid, in two months more the net earnings of the mill will pay the whole expense of erecting the mill, bringing water to it and building a road from the mill to the mine. No ore has yet been crushed from the richest part of the lode, but the ore crushed has averaged $30 per ton, and every pound of the ledge, 27 ft. in width, has been crushed. Water has been brought in a flume down the Hassayampa, a distance of 7 miles, at a cost of $7,000, and an abundant supply is assured. The ore is hauled a distance of 11 miles at a cost of $5 per ton. There is a gradual down-grade from the mine to the mill, and 8 tons are drawn with 1 team. Wood is abundant, and is delivered at the mill at $3 per cord. There is a little daily profit made at this mill, after paying all expenses, of about $360 per day, and it is estimated that there is ore enough in sight to keep the mill running for the next 10 years.

FROM MOHAVE Co. we have no news of importance. There is a great deal of energy displayed by claimowners in sinking upon and developing their claims, in order that their value may be determined upon, and, in most instances, a general feeling of confidence has been the result. There are many experienced men from California and Nevada in the districts of that county, at present, acting in the interest of capitalists, and it is probable that, before long, we will hear of transactions of considerable magnitude.

BIG BUD DISTRICT.—Arizona *Miner*, Aug. 16: In the Silver Stag mine there are two men working; we found it a very well defined ore, with regular walls of Tsicose slate. Upon stripping it, between 18 and 24 inches of rich silver ore lay together in one solid vein. A cut shows the west face of the vein to good advantage.

Taking pieces of ore from every stratum, leaves, bunches and specks of almost pure silver were seen in every piece, in whittling down which, with our knives, two or three dollars worth of silver must have been wasted. Besides the assays of from $200 to $1,000 gotten out by Mr. Jewell, of this place, a piece of poor quality of the ore recently taken to Cerhat, Mohave Co., by Governor Safford, was there assayed by a very competent assayer, whose certificate gives $400 per ton in silver, with traces of gold.

Mr. Hellings has let a contract for sinking a 20-ft. shaft, which is now being driven into the mine.

MONUMENT.—In the Monument 4,500 ft. has been located. The discovery location, upon which excavating is going on, is claimed by Messrs. Rees, Hellings & Shultz.

BOWERS' MILL.—Are working an arastra, in which ore from a very large ledge, out on the Verde road, is undergoing a working process. The ore is paying pretty well. They will not make a regular clean-up until some 30 tons are worked. To give an idea of the size of their lode, all that is necessary to say is that in less than two days the two gentlemen in question loaded a large freight train with the ore, which is mostly of a dark, reddish cast, containing numerous particles of free gold. The hauling of the ore cost them $5 per ton.

There is, at all seasons of the year, at the point they are working, a sufficiently large stream of water to run a 20-stamp mill. Below their place are several good mill sites, and here will Messrs. Barney & Hellings erect works, should their prospecting be crowned with success. Besides water, timber, grass and good roads are found in the locality of which we speak, so that a very short time may see it the liveliest mining district in the Territory.

MOHAVE COUNTY.

There is news that the Hibernia mine, in Cedar Valley District, has been sold to San Francisco capitalists for a large sum of money.

TIGER AND PINE GROVE DISTRICTS.

WAR EAGLE.—Three tons of ore produced $200. A week ago 35 oz. of gold was got from 6 tons. Abundance in sight of the same kind.

Jesse Jackson informed us that his claim on the same lode, was looking well. He has abundance of rich rock, and a recent thunder shower afforded sufficient water to enable him to go to crushing.

Wm. Cole and other miners have sunk 60 feet on another claim in the same ledge, and are happy in the enjoyment of a big pile of rich rock.

Various other individuals talk of building arastras, and we hope they will do so, as in such working lies our only salvation for the present, for, talk as we may, mining is our best, most reliable and trusty resource.

WICKENBURG.—Smith's mill in Wickenburg district, is crushing away, filling batteries and plates with the pure stuff. Everything works to a charm, and proprietor and employees are happy as clams.

Our placer miners are taking out the usual quantity of gold dust. The recent rains have been a God-send to them and the country.

YUMA COUNTY.

Mr. A. Frank, of Ehrenberg, on the Colorado river, who is now here, has been pleased to inform us that work will soon again be renewed on the Constantia lode. New machinery is coming from San Francisco, and the owners have great confidence in the richness of the mine, especially since tailings, worked in San Francisco, have paid over $30 per ton.

Now, that the heated term is about over, active operations will soon commence at Castle Dome and other points on the lower Colorado.

Mineralogical Notes on Utah, California and Nevada.

The following mineralogical notes of Pacific Coast interest are published by Professor Silliman in the *American Journal of Science and Arts:*

Enargite, $3Cu\,S + As^2Sb^3$.

This hitherto rare mineral exists in two or three localities in a district of Southern Utah, known as the Tintic District, about eighty miles south of Salt Lake City. The localities are (1) the Shoebridge Mine, (2) the Mammoth vein, Eureka Hill, East Tintic, and, (3) the Dragon Mine, East Tintic. All these localities occur in metamorphic crystalline rocks of the granitic family.

The Shoebridge locality furnishes finely crystallized specimens, associated with octahedral pyrite. The vein in which it is found fills a fissure about four feet wide in granitic rocks. This vertical fissure is filled to the depth of about 80 feet from surface with enargite mixed with pyrite. The whole mass is regarded as a silver ore. A sample of the ore made up from such stock as I had in hand yielded to fire assay 269·25 oz. troy of silver, or $347.34 to the ton of 2,000 lbs.; this is equal to 0 841 per cent. of silver, which is considerably above the average value of the vein. Below the depth of 80 feet, the character of the vein changes, as I am informed by one of the owners, Mr. Samuel T. Hatch, of Salt Lake City, to a vein of argentiferous galena, carrying some antimony. In examining many hundred pounds of the ore taken from above the galena zone, I found only enargite and pyrite with quartz and some heavy spar as a gangue—and not a trace of galena, as the analysis proves.

The enargite from Shochridge mine cannot be distinguished by the eye from that which was first mentioned by the late Prof. Root, from the "Morning Star Mine" in Alpine County, California (this Journal, II, xlvi, 201.)* It occurs both massive of a brilliant lustre and fractnre, resembling in color gray copper; and also in brilliant orthorhombic crystals striated on the terminal plane parallel to the longer diagonal. The crystals are sometimes 5 or 6mm. long, but more commonly are not over 2mm. in length. The forms are more simple than the crystals figured from Peru. Dr. Gideon E. Moore, who has studied those from the Morning Star Mine, informs me that their form is identical with the the Shoebridge mineral, and is expressed by the crystallographic formula $\infty P.\ 0P.\ \infty\breve{P}\ \infty.\ \infty\breve{P}\ \infty$.

Its pyrognostic characters conform to those of the Peruvian mineral, but it contains much less antimony than the California variety. Its specific gravity is 4·861 in fragments to 5·111 solid—almost that of pyrite, and somewhat higher than the Peruvian variety. Mr. E. S. Dana kindly furnished me some time ago the following approximate analysis of the Shoebridge mineral made by the chlorine method upon carefully selected crystals. He obtained,

Sulphur	34·35
Antimony	·95
Arsenic	17·20
Copper	46 94
Iron	1·06
Zinc	*trace*
Residue, (undissolved,)	*trace*
	100·50

The silver was not determined. The iron is probably due to the pyrite, with which the species enargite is intimately associated; this occasions also the excess of sulphur, in the analysis, which corresponds, however, sufficiently well with the formula given above.

At the "Mammoth Vein," in Eureka Hill, the enargite occurs in broad laminated masses somewhat resembling black hornblende, and stained green in the joints by the oxidation of a portion of the copper. It is associated with calcite and is quite free from pyrite. The blowpipe shows it to be free, or nearly so, from antimony. This locality has not furnished the enargite otherwise than in columnar and cleavable masses.

The mineral from Dragon Mine resembles the last named variety, but is more massive. Neither of the two latter varieties have been analyzed.

Bismuthinite, B^2S^3.

This species is found rather abundantly in three associated mineral veins in Granite Mining District, Beaver County, Utah, about ten miles west of Beaver City. The main vein, which is said to be about six feet in thickness, contains also bismuth ochre or *bismite*, Bi, staining the surface greenish yellow (a sign by which the vein has been traced at intervals, it is said, for about 2,000 feet,) and *bismutite* (hydrous carbonate of bismuth,) $Bi^4C^3H^4$, in yellowish-gray masses inclining to siskin-green. These last two species are due, no doubt, to the oxidation of the bismuthinite.

These three species sometimes form masses of considerable size, but more commonly the sulphid occure alone in a gangue of almandin garnet of a hair-brown color, with black hornblende, heavy spar and quartz. Yellow pyrite exists in small quantity in the gangue, and by its oxidation has furnished masses of iron oxides. No arsenical ores could be detected in the samples which have fallen under my observation, nor does the blowpipe detect either lead, antimony or copper.

Hitherto bismuthinite has been a rare species in N. America, and I do not know that it has before been found in quantity likely to give it a commercial value.† In the Beaver vein, the metal is said to form about five per cent. of the mass.]

When this locality is properly opened for mining we may hope to obtain an abundance of good mineralogical specimens of these several species. I am indebted to Mr. J. B. Meader, of Salt Lake, and to Col. Head of San Francisco, for the specimens from Beaver, which I have examined.

Wulfenite.

In a former communication (this Journ., III, iii, 195) I pointed out the absence, as far as observed, of phosphates among the mineral species found in the Wahsatch Range, and the existence of molybdic acid as wulfenite in its place. Further observation has confirmed this statement. In a subsequent visit to that region, and more recently, I have received from Major Wilkes, of Salt Lake City, wulfenite from the Empire mine, Lincin District, Box-Elder County, Utah, in the Wahsatch Range, which for beauty is rarely equalled by the same species from any known locality. The crystals are thin tablee 20 to 30mm. broad, of a pure yellow color set on a deep brown iron ochre, and making splendid cabinet specimens.

Orpiment and Realgar.

These two species are found with galenite in a vein known as the "Lucky Boy Mine," in Butterfield Cañon, which is in the Oquirrh Range on the west side of Jordan Valley, Utah.

Pricite.

This borate of lime, which I received from Mr. Thomas Price, in San Francisco, in March, 1872, has been noticed by Mr. Chase, and its mode of occurrence and probable origin described by him in this Journal (III, v, 287,) accompanied by two analyses. A recent examination of this mineral—of the soft chalky variety—affords the following results: Its specific gravity is 2·262 to 2·298. It resembles chalk, but is even softer than that mineral. Its powder under a half inch magnifying power is seen to consist exclusively of minute rhombic crystals. It is insoluble in water which removes only a very minute quantity of common salt, not a constituent of the mineral. It dissolves completely in dilute hydrochloric acid, and this solution promptly deposite abundant crystals of boric acid. Its filtrate is completely free of sulphates, and reacts only for lime, with a trace of iron and alumina. In the close tube it evolves abundant neutral water, and at a red heat fuses to a white enamel. The spectroscope discloses from its solution in hydrochloric acid only the double spectrum of horic acid, with the lines of calcium and sodium. It contains no carbonate of lime, which might very naturally be looked for. Five grams of the air-dried mineral afforded me by the volumetric method only 0·7 c.c. of CO_2, equivalent to 1-25,000 of calcium carbonate in the weight taken—hardly a trace.

Its water of constitution is very constant—and it is almost non-hygroscopic. Two determinations of the water in the air-dried mineral gave 18·395 and 18·40 per cent. of water, while two of the same dried at 212° gave each 18·29 per cent.

Dried at 212°, three analyses made by hydrofluoric acid—which leavee the boric acid to be determined by the loes—gave as follows:

	1.	2.	3.	Mean.	Ox'g'n ratio.
Water	18·28	18·29	18·29	18·29	1·8
Lime	32·38	31·37	31·73	31·83	1
Ns Cl. Fe Al	·93	1·00	·97	·96	
Boric acid	48·50	49·34	50·01	49·00	3·7

The oxygen ratio gives approximately 4B, 3Ca, 6H; the lime is a little too high. The probable formula of the mineral is $Ca_3B_4 6H$, which makes the mineral to differ from hydroboracite by containing one-third less water and no magnesia. This formula requires: water 19·43, lime 30·21, horic acid 50·36 = 100.

This mineral is certainly different from the cryptomorphite of How, to which it has been provisionally referred by Price and others. It has the microscopic crystallization described by Dr. Robb as belonging to the Nova Scotia species; but the absence of soda and the greater ratio of the protoxide base carries it much nearer to hydroboracite, from which it is separated by containing no magnesia and less water. It is certainly not a mechanical mixture, as its finely divided condition might seem to indicate. The microscope completely ensitains the constant results of analysis on this point. As it appears therefore to be a new species, I would propose for it the name *pricite*, in honor of Mr. Thomas Price, the well known metallurgist of San Francisco. Mammillary and radiate masses of aragonite, some of great size, but more frequently as crusts, occur with the pricite, and were at first mistaken by the miners for a variety of this borate of lime.

*Wrongly quoted in Dana (5th ed.,) p. 797, as in vol. xlv.

†I have observed it in minute prismatic crystals in the well-known chrysoberyl locality at Haddam, Conn.

[To be continued.]

SEVENTEEN years have passed since H. Deville first produced aluminum on a commercial scale; but the expectations regarding this very interesting and meritorious invention of the distinguished French chemist have not as yet been fulfilled. Although many of those expectations were somewhat exaggerated, they were not and are not so unreasonable as many people believed them to be; for a metal with so many valuable properties would be useful in many of the technical arts. Among these properties are a beautiful color that does not change in the air, nor yet in sulphurous exhalations, and further, remarkable lightness, an agreeable resonance, and a capability of being worked into any shape. Moreover, in the use or manipulation of aluminum, there have not hitherto been observed any deleterious effects.

Gum Plants.

In previous numbere of the PRESS we have given engravings of some of the most ueeful oil plauts, spice plants and fruits, indigeuons too, or successfully introduced into the United Stetee. We now pass to the consideration of certain gum plants, which, though nsually clessed among exotics, are yet susceptible to a certain degree of successfnl cnltivatiou in Californie.

Gamboge.

This gum resin is yielded hy severel plants. That known as Ceylon Gamboge is obtained from *Garcinia Morella*, a fiue tree with glossy foliage, somewbat like that of the evergreen magnolia, and repreeented in miniature hy Fig. 1 of onr engrevings. This plant is supposed to he a native of Siam, bnt hee beeu introduced extensively into other tropical countries. The gum is ohtaiued by making incisions in the bark, or hy breaking the branchee and collecting the juice as it drops. It is ueed as a pigment in the arts, aud medicinally as a purgative.

American Gamhoge is obtained from *Vismia Guianensis*, a shrubby plant found in Surinam and Mexico, which ahounds in a yellow, resinons juice, resembling in its appearance, as well as other properties, the gamboge of Ceylon. There ere other epecies found in Brazil and Guiana that yield similer resins.

Benzoin.

Sometimes called Gum Beujamin, is obteined from the stems of *Styrax Benzoin*, Fig. 2, a native of Borneo, and other Indiau ielends. Incieions are mede in the hark from which the jnice exudes, hut edheres. When dry it ie removed with a chisel or blunt knife. The gum which exudes from the uatural fissnres is considered the most valnable, having a stronger perfume than that produced from wounds in the tree. It is ueed medicinelly, hy perfume makers, and as a compound in the mixtures used ae incense.

Caoutchouc or India-rubber.

Oue of the principal plents furniehiug this suhstance ie *Siphonia Brasiliensis*, Fig. 4., a common tree in the forests of Para, Brazil. This gum exists in the tree in the form of a thin, white milk, and is obtained by making incisions in the trunk, from which it exudee, and is collected in vessels, and afterwarde converted into the homogeueous, elastic mase, familiar to ns ae India-rnhher, hy pouring the milk npon molds, and immediately holding them over a dense smoke. As it solidifies, another coating is formed over it, and the proces ie repeated until the required thicknese is secured. *Siphonia elastica*, *Siphonia lutea*, aud *Siphonia brevifolia* also furnish India-rubber of good qnality. Others of this genus yield an inferior, hrittle gum.

Gutta Percha.

This is the dried juice of *Isonandra gutta* Fig 4. a large forest tree, reaching a height of 60 or 70 feet, with a trnnk two or three feet in diameter. It ie a native of the islauds of Southern India, eepecially of Borneo and Snmetra.

Balata gum is an elastic gum ohtained from *Mimusops balata*, a netive of British Guiana, where it forms a tree of large dimensione. The milky juice is obtained by incision of the trunk. It dries very qnickly on expoeure to the air, if the air is dry, and can be molded into shape by heing firet softened in water. Thie gum seems to be of a character intermediate between India-rubber and gutta percha, posseesing the elasticity of the one and the ductility of the other, without the intractahility of Iudia-rnbber or the brittleness of pure guttta percha. It is successfully employed as an insulatiug medinm for telegraphic purpoees.

ONE'S HAND.—It is a profound study. No instrument devised hy man compares with it for complication. It is a hammer, a vice, a forceps, a hook, a spring, a weight; it puehes, draws in, and the fingers alone coutain elements of chisels, gouges, and all the tools a sculptor requires in modeling. From the elbow to the digital extremitiee ite movements are prodnced by nearly fifty muscles. So complicated ie the cordage of a hnman haud, expert anatomists can hardly keep in remembrance ite intricate mechanism. With it all the emotione of the mind may be hoth manifested aud intensified. How could a Frenchman talk with his hands tied? The hand is the prime minister of the hraiu. It ie the soul's agent in the accomplishment of its designs. It is a wonder of wonders.

THE Pensylvania R. R. Co. have at Philadelphia the largest rounde house in the United Statee. It has 44 tracks, aud accommodation for as many locomotivee.

How Salt is Made.

The Bay City *Tribune* gives the following interesting facts conceruing the mannfacture of salt by the varions procesece in the Saginaw Valley:

Of course the first etep in the mauufacture of salt is to get the brine. In sinking welle for this purpose the first etratum reached after passing through the alluvial depoeit on the eurface, is the coal field, covering iu this State an area of ahout thirteen couuties. Beneath this is the Parma sendstone, where the first brine is found, but it is so week that wells rarely stop here, but are pushed down through the carboniferous limeetone, and the gypseous group to the Napoleon eendstone, whence comes all the hrine. The depth of wells varies from 760 to 1,000 feet and even more, one well in the Portsmouth heing, we believe, 1,050 feet deep. The proposition has been made to put wells down to the rock salt, an estimated depth of 2,000 feet, and it is proheble that at no distant day, the suggestion will be acted upou. After the well is bored aud tnbed the hrine is pumped out with a steam pump, the working valve being 700 to 900 feet below the surface, according to the depth of the well. The brine hes a strength of from 85 to 100 per ceut. ae tested by a salometer. It bae many impurtiies, the principal of which is the carhonate of iron. The impurities are taken out in large settling cisterus, generally twenty feet hy thirty, holdiug from 22,000 to 25,000 gallons of hrine. Over the top of the brine is sprinkled a solution of caustic lime. The brine is then thoroughly "plunged," that is, it is stirred np until the lime is well mixed with the brine. It then stands in the cisterns ahout forty-eight hours before being drawn into the steam settlere in the salt block proper, where it is further prnfiled and brought to the point of saturation, that is, a point just preceeding the formation of salt cryslals. In the steem eettlers the hrine is kept warm and the little thin, square, salt pelliclee which form on the snrface and sink to the bottom, essist in carrying down the impurities. From the eteam settlers in

The Steam Evaporating Process,

It goes to the grainers, long wooden vats abont ten feet wide, aloug the bottom of which run galvanized iron pipee about four or five inches in diameter, through which exhaust or live steam is forced. The grainers are kept at a very high temperature, sometimes reaching 176 degrees, and the evaporation is very rapid. Twenty-four hours is snfficient to evaporate the water, leaving the grainer two-thirds full of a damp salt of a snowy whiteness. It is now "lifted" to the draining boards, a kind of pathway running over each grainer and communicating directly with the salt hins. On theee boards it should remain to dry thoroughly, twenty-four honrs, if possible, hefore going to the hins. It lies in the bins two weeke to complete drainage, when it is ready for inspection and barreling for shipment.

A large salt block in connection with a mill can he operated very cheaply. It can he rnn almost entirely hy the exhanet steam from the mill, which makee the expense little or nothing. Then the edgings of the mill furnieh ample material for the menufactnre of barrels. In one of our largest blocke the contract for mannfacturing the salt, the proprietor of course owning and furnishing everything, is let to a man for twenty-eeven cents per harrel, delivered on the dock. Add to this the coet of the harrels, and the actual cost of a harrel of salt ready for shipment ie from sixty to seventy-five cents; the latter figure probahly being abont the everage. Fine salt, delivered on the cars, brings at the present time about $1.50 per herrel, delivered on the dock $1.45. The capacity of steam blocke varies, the lergest in the valley being capahle of tnrning out ahrut 400 harrele per day. Each block has from one to four wells according to ite requirements. Oue block that we visited having five grainers and two settlere, with a capecity of 150 to 170 barrels per day, is said to have cost $19,000, and to have cleared it in the first yeer. It employs at present ahout sixteen men, and proposes to double its capecity, It is now shipping daily six car loads and 1,000 harrele by boat, and has made since the middle of April ahout 10,000 barrels. A barrel of salt contaius five bushele of fifty-six ponnds, or 280 ponnds.

The Pan Process

Is heing largely introduced of late and gives a very satisfactory grain of salt. The hoiling is more rapidly and easily controlled. The process recommends itself on account of the economy of heat and fuel, as also in the better separation of the bitter weters. The pans are of sheet iron, 120 feet long by 12 feet wide, and one foot deep. The front part ie protected hy a patent arch, which prevents the baking of the salt on the pans and tends to the more even distribntion of the heat. The salt as fast as made is raked out on the draining hoard, end the refuse or hitter waters are frequently drawn off. In

The Kettle Process

There are usnally from fifty to sixty kettles placed in douhle rows, over hrick archee, extending from the mouth of the furnace to the chimney, and separated merely by a dividing wall. The arches are three feet deep in front, but the hottom gradually risee to the hack kettles, where the space is only ten or twelve inches. The first kettles are protected hy patent arches. After hoiling a ehort time in the kettlee, crystals form iu the brine and eink to the bottom. When the hriue is hoiled to ahout one-third, the ealt ie dipped out with a ladle and thrown into haskets, etanding on the edge of the kettles, for draining. Thorough drainage is the important point, for if the hitter waters are not entirely drained from the eelt they are apt to give it a red, rusty color. The first preparation for

Solar Evaporation

Is to have a series of "covere" or wooden vats, each vat heving a roof running off or on, to protect or expose the brine, according to the weather. These separate vats with their covere are called "strings," and at the end of each string, eomewhat higher than the vate, are the settling cieterns, into which the brine is first pumped. No lime is used in settling in this process. After settliug, the hrine is drawn into the graiuing vete, and exposed to the action of the sun and atmosphere. The time required for evaporation of couree depends largely npon the weather, six weeks or two months heing the usual time. Two or three crope per season can be gathered, the first abont the 15th of July, the second in the early part of September and the third and last in October. The first crop is generally considered the best, ae it is coarser thau the others. Beef and pork packers prize thie salt highly on account of its coarsenese. After beiug gathered it is put in bins, drained and packed in bulk. Saginaw Valley coaree salt stands es high in the market as any other, and is in great demand for pork and beef packing. There are five solar fields in the valley, one of them coutaining 2,736.

General Statistics.

We give below a tahle ehowing the number of harrels produced in varions yeais, beginning with 1860. It will be seen that there was an immeuse increase from 1860 to 1861. Thie wee owing to the war, in the eerly part of which, the price of salt ran up to three dollere per harrel, of course greatly stimulating ite prodnction.

TOTAL PRONUCTION

	Bbls.
1860	4,000
1861	125,000
1870	646,515
1871	732,437
1872	724,481

We give only a few yeare, as our object is more to present a generel view of the bueinees, than to give a strictly eccurate stetistical accouut of it. The sum totel produced since the mauufactnre began, is 5,983,341 barrels, or nearly 30,000,000 hushele. There ere at present nearly 100 selt blocks in operation, several new ones heing erected this season. These blocke fnruish employment to ahout 1,000 meu, and represent a capital of $2,000,000. There will prohably be prodnced this year 750,000 or 800,000 harrels. These figures snffice to give one an idea of the magnitude of the ealt intereet in the Saginaw valley, and will convince any one that it is not to lumber alone that we are indebted for onr prosperity.

Of the total numher of harrels produced in 1772, the sixth and seventh inepection districts, comprising Bay City, Portsmonth, Salzhurg, Banks and Kawkawlin maunfactured nearly 300,000 barrele, or almost half. Bay City and Portsmouth are now one, and doubtless produce most of the salt made iu the two districts mentioned above. When the ahove estimate was made, one of our largeet selt blocks in the city was doing nothing; another has eince donbled its capacity; new onee are building, and from these data it is eafe to assnme that our city will, in 1863, produce half of the ealt made in the Sagimaw Valley. From that to the production of more salt than all the rest of Michigan, is bnt a step, which will be taken in the not very distaut future. In the compilation of the ahove article we ere indehted to Dr. S. S. Garrigues for much valuahle information, and also to the proprietors of eeveral of the salt blocks of this city and vicinity.

GUM PLANTS.

NICKEL.—Nickel was given its name by the discoverer, Comstedt, in 1751, in a derisive manner, it having heen extrected from the ore called copper nickel. The Saxon minere, in search of copper, diecovered a mineral resembling copper in appearance and color, but were disappointed in not ohtaining a particle of copper from it; they rejected it with the expression of a nick or copper nick, which name wae then converted into copper nickel. The emerald nickel ie a native mineral found encrusted ou chromic iron in Texas, Lancaeter county, Pa., aud is a hydreted oxide of nickel. Nickel hae a white color, intermediate hetween that of eilver and tin, hes a lustre between eteel and platinum, takes a high polish, is perfectly malleahle, may be forged when hot into bars, and bammered into plates when cold. It is very dnctile, and may be drawn into fine wires. Ite specific gravity is 8.28, and when forged, 8.7; coudncts heat, obeys the magnet, aud is itself capehle of becoming megnétic, but it loses its magnetic property when heated to 350°; it retains, however, the eame whenever alloyed with arsenic. The characteristice of the metal nickel were but little known in the heginning of this century, when it was thonght to be a modificatiou of iron, on account of its magnetic property; while others snpposed it to be an alloy of copper.

IRON ORE IN TASMANIA.—A large field of iron ore of superior quality hae heen discovered near Ilfracomhe bay, Tasmania. It it is now being profitahly worked, and companies intereeted expect soon to export largely the iron produced.

Useful Information.

Cements.

Many of these preparations, into the composition of which resins, gums and albuminous bodies enter, act by adhesion, while the mineral cements in architecture behave differently in consequence of a chemical union being formed between them, and the body of the substance. Cements are of many different kinds, according to the purposes to which they are to be applied.

For mending glass or china-ware, there are several receipts. One is as follows: Steep isinglass in water till it swells; dissolve in proof spirit to which a little gum-resin, gum ammoniacum, or rosin mastic, is added; heat gently before using. This resists moisture to a certain extent. Another is, two parts of shell-lac, dissolved in one of oil of turpentine, cast into sticks, to be dissolved in spirit and evaporated to the consistency of syrup. Keller recommends two parts of fish glue steeped for twenty-four hours, in sixteen parts of water, then to be boiled down one-half, an equal amount of alcohol is added, and the whole strained through linen; while warm, a solution of one part of mastic, in nine of alcohol, and one-half a part of gum ammoniacum gradually added. Shell-lac dissolved in spirit or in a concentrated solution of borax is very effective. White of egg mixed with quicklime, makes a very strong cement, but does not resist water well. Blood and the caseiu of cheese are substituted for the albumen of white of egg, for uniting metals and stone-ware. The cement used in philosophical instruments, to unite glass and brass, is made of five pounds of resin, one of beeswax, one of red ochre, and two table-spoonsful of plaster of Paris, all melted together. A colorless cement is made of white wax, resin and Canada balsam. Mastic is the common jeweler's cement.

In architecture a great variety of cements are used. These are known as building cements. Mortar is a mixture of slaked lime and sand in proper proportions. Lime alone is capable of forming a hard cement, if used in very thin strata, and between regular and tolerably smooth surfaces. Such mortars as have the property of hardening under water are termed hydraulic cements. Certain impure limestones when burned afford a lime which acts very differently from the pure "fat" lime as it is called. They usually contain, in addition to the normal carbonate of lime, carbonates of magnesia, protoxide of iron and protoxide of manganese, silica, alumina, oxide of iron, carbon and water, and the lime obtained by burning is made up essentially of lime (pure), with varying proportions of magnesia, clay and oxide of iron. Among the hydraulic cements are the Roman, Portland, Medina, Mulgrave, Parian and many others, all composed of similar or equivalent substances, but differing much in quality, to meet the varying requirements of the builder's art.

Iron and Steel in Early Times.

A late number of *Nature* gives the following interesting notes on the use of iron and steel by the ancients: "Iron was not in common use till long after the introduction of copper. It is far more difficult to procure, because it was not met with in the native state, and the fusing point is very high. The metallurgy of iron is more complex than that of copper, and when obtained it is a more difficult metal to work. According to Xenophon, melting iron ore was first practiced by the Chalubes, a nation dwelling near the Black sea; hence the name Chalupe used for steel, and hence our word *Chalybeate* applied to mineral waters containing iron. Steel was known to the ancients, but we do not know by what means it was prepared; it is tempered by heating to redness and plunging in cold water. According to some, the kuanoe mentioned by Homer was steel; but Gladstone prefers to conclude that it was bronze. Iron was known at least 1537 B. C. It was coined into money by the Lacedæmonians, and in the time of Lycurgus was in common use. It was used in the time of Homer for certain cutting instruments, such as woodmen's axes, and for plowshares. Its value is shown by the fact that Achilles proposed a ball of iron as a prize for the game in honor of Patroclee.

"Neither iron money nor iron implements of great antiquity have been found, because. unlike the other metals of which we have spoken above, iron rusts rapidly, and soon completely disappears, No remains of it have been found in Egypt, yet Herodotus tells us that iron instruments were used in building the pyramids; moreover, steel must have been employed to engrave the granite and other hard rocks, massive pillars of which are often found engraved most delicately from top to bottom with hieroglyphics. Again, the beautifully engraved Babylonian cylinders and Egyptian gems, frequently of corneliau and onyx, must have required steel tools of the finest temper. We have no record of the furnaces in which iron ore was smelted, but we know that bellows were in use in the fifteenth century B. C., in Egypt, and some crucibles of the same period are preserved in the Berlin Museum. They closely resemble the crucibles in use at the present day." We may add that Mr. Layard found an iron saw at Nineveh.

Curious Instincts of the Bee.

Honey bees are governed by instinct and not by art. They never deviate from the course they were created in. The first comb they ever built was as perfect as at the present day; no art has improved the shape or size. One bee lays all the eggs, while others raise the young and protect them; each bee does its part of the labor, in gathering in the stores and nursing the young; and I have noticed for several years past their mode of gathering pollen or bee bread. It is this: When a bee goes out after food, it alights on some kind of flower and gathers part of its load; then goes to another of the same kind of flower, and perhaps the third, to obtain a load. Another bee goes out, and if it alights on another kind of flower it keeps that kind until it gets a load. But how is this known? You go to the hive and watch them as they come in; some have yellow pollen on their legs; others have light color; others have dark; but no bee has two colors on his legs. If you see any, you will see more than I have, for I never did; and have supposed that they stored it in different cells for a change of food. The other day in overhauling a hive, I broke out a new piece of comb and found the different colors in different cells, which confirmed my belief; for I suppose that they like a change of food as well as human beings.

Another curiosity is their coming out and alighting before going off; for amongst the hundreds that I have hived, I never had one swarm leave direct from the hive. Another curious thing is their rearing the males and nursing them so tenderly; and after they become useless they destroy them. But instinct has directed them to do it. Another curious thing is that, when they get too numerous, the mother should call out a part of the brood to go with her and leave the others to take care of the young. Why not call them all out to go with her? Because instinct has ordered it otherwise. Certain ones go out with her while others are coming in with stores for future use. A certain part of them don't seem to have any inclination to follow the mother bee, nor do they mourn her loss, for another is provided.—*Selected.*

Fat Men.—It is a notable fact in criminal statistics, that no fat man was ever convicted of the crime of murder. Stout persons are not revengeful; nor, as a general thing, are they agitated by gusts of passion. Few murderers weigh more than ten stone. There are however, exceptions which justify us in assuming eleven as the utmost limit of the sliding scale, but beyond that there is no impulse toward homicide. Seldom has such a phenomenon as a fat horse-breaker been paraded at a criminal bar. It is your lean, wiry fellow, who works with skeleton keys, forces himself through closet windows which seemingly would scarce suffice for the entrance of the necessary cat, steals with noiseless step along the lobby, and up the stairs, glides into the chamber sacred for more than half a century to the chaste repose of the gentle Tabitha, and with husky voice, and the exhibition of an enormous carving knife, commands silence on pain of instant death, and delivery of her cash and jewels. It is your attenuated thief who insinuates himself under beds, behind counters, dives into hills, or makes prey of articles of commerce arrayed at shop-doors for temptation of the credulous passenger. A corpulent burglar is as much out of place, and as little to be feared as was Falstaff at Gadsill—and what policeman over yet gave chase to a depredator as bulky as a bullock? Corpulence, we maintain, is the outward sign not only of good constitution, but of inward rectitude and virtue.—*English Journal.*

Insect School of Medicine.—Insects bore a prominent part in the materia medica of former days; and then much could be said of their great value in preventing diseases and effecting cures. They were administered with as much confidence in their efficacy as is now given to the medicinal plants of the garden or the tinctures of the apothecary. They were generally given in the form of pills. Five gnats were equal to three grains of calomel. A lady-bird was a sovereign remedy for colic and measles, and a cockchafer for hydrophobia and the plague. Ants were considered to be invaluable against leprosy, and of great efficacy in strengthening the memory and giving wonderful vigor to the whole frame. An Italian professor declared that the finger imbued with the juice of a little insect having the pretty name of *rhinobatus antiodontalgicus*, will retain the power of curing the toothache for a year! These prescriptions are not now very often given, but it would not be the strangest thing that ever happened, if insect remedies should again be resorted to, and among allopathic, hydropathic, homeopathic and botanic physicians, we should find the entomologic physician, with his milliped, lady-bird and cockchafer, claiming a pre-eminence over all.

Gelatin is used in the laboratory as a test for tannic acid, in medicine as an emollient and demulcent, in pharmacy as a coating for pills and for capsule covers, and in cooking for making jellies and blanc-mange. Lately it has been employed as a photographic base in producing the photographic engravings, by being rendered sensitive by silver salts in the usual manner.

Good Health.

The Human Windpipe.

The windpipe is that tube through which the air or breath passes to and from the lungs. It commences in the throat at the root of the tongue, and extends down to the lungs, where it divides into two branches, one of which enters the right and the other the left lung. These branches are again subdivided into innumerable smaller tubes, which ramify in every direction through the substance of the lungs; and finally terminate in little clusters of cavities, which are formed around their extremities, like grapes around their stem. These are the *Bronchial Tubes* and the *Air Cells*. Now, the windpipe is composed of two parts; or rather—we give different names to different parts of the same tube. Thus the first or upper part is called the Larynx, and the lower part the Trachea. The larnyx commences at the root of the tongue, and extends down below that singular prominence on the front of the neck of man, known as the "apple of Adam," so named by the ancient anatomists, from the fanciful idea that it represented the difficulty experienced by our primeval ancestor in disposing of the forbidden fruit. The larynx is composed of several strong cartilages serving as a frame-work to protect the delicate organs of the voice. Being furnished with vibrative cords, it forms a perfect musical instrument, more or less under the control of the will. By the perfect action of these cords, the vocalist and the speaker are enabled to produce that infinity of sound which conduces so much to our enjoyment. The entrance into the larnyx is closed by a little valve, which rises up from the root of the tongue. This is the *Epiglottis*. On the approach of food or drink, the little sentinel compels the nutriment to pass on to the stomach, but will permit none to enter the windpipe. Below the vocal cords, which are situated from half to three-fourths of an inch below the entrance, the larnyx enlarges, becomes irregular, and soon ends in the trachea. The whole length of the tube to which the name larynx is applied, is not more than from one and a-half to two inches.

Carriage of the Body.—Instead of giving all sorts of rules about turning out the toes, straightening up the body and holding the shoulders back—all of which are needless, because soon forgotten, or because of a feeling of awkwardness or discomfort, which procures a willing omission — all that is necessary to secure the object is hold up the head and move on, letting the toes and shoulders take care of themselves. Walk with the chin but slightly above a horizontal line, or with the eyes directed to things a little higher than your own head. In this way you will walk properly, pleasantly, and with no feeling of restraint or awkwardness. If any one wishes to be aided in securing this habitual carriage of body, let him accustom himself to carrying his hands behind him, one hand grasping the opposite wrist. Englishmen are admired, the world over, for their full cheeks, broad shoulders, sturdy frames and manly bearing. This position of body is a favorite one with them, in the simple promenade, in the garden or gallery, in attending ladies along a crowded street, or in public worship.

Medical Uses of Charcoal.—A lecture was recently delivered before the Society of Arts, in London, by Mr. W. E. Newton, in which he attributed various virtues to peat and other vegetable charcoal. He stated that in the form of powder, put upon poultices, peat charcoal had been most beneficially employed in some of the London hospitals, especially in cases of offensive sores. It absorbs the putrid effluvia, and was of great benefit in cancers, etc. In many cases, when taken internally it was productive of good effects in those troubled with disordered stomachs, such as heartburn, sick headache, palpitation of the heart and giddiness. In all diseases of the chest, sore throats, diptheria or bronchical affections, peat charcoal has been found very useful. In France, a scientific commission appointed by government to investigate this subject, has reported very favorably in regard to the usefulness of this substance for a great number of purposes. A minute quantity of peat charcoal, in powder, boiled with some American corn starch and milk, has been given with almost miraculous success in London for curing dysentery.

Excreting Powers of the Skin.—Not only do the capillaries of the skin keep up an uninterruped discharge of carbonic acid, and take in oxygen in return, but this organ is also abundantly provided with small glands of two kinds, excreting from the blood the perspiration and the sebaceous or greasy substance of the skin. The perspiration contains many regularly detached scales of the epidermis. Beside a small quantity of fat, several volatile organic acids, consisting only of carbon, hydrogen and oxygen, are the principal constituents of the perspiration. The chemist calls these butyric, butyro-acetic, and formic acids, and classes them in one group as being in their composition very similar to the fatty acids, to which butyric acid belongs, also with respect to its other properties. These acids occasion the sourness of the perspired fluid. Common salt, chloride of potassium, sulphates of the alkalies, and traces of phosphates of lime and iron, are also dissolved in the perspiration.

Domestic Economy.

The Philosophy of Frying.

Perfect frying is the perfection of cooking; but as soon as the fat is not sufficiently hot to create the burnt crust around the article fried, then the fat penetrates it and absolutely prevents cooking from taking place at all. If the fat is not boiling, bubbling hot, the process that takes place is not cooking, but simply drenching the food with a tepid fat, and rendering it totally indigestible. It makes no difference how hot the fat is made afterwards, the mischief is done the moment the fat penetrates inside. All perfectly fried food has a thin crisp, brown, outside crust, (which has in itself a pleasant, relishing taste,) and is perfectly free from even the suspicion of fat inside, except what was intentionally put there by the cook. All housekeepers know that to fry well, their fat should be hot. But they do not attend to it half as scrupulously as they would if they understood the true philosophy of it. Boiling, bubbling hog fat cannot penetrate anything, and cooks to perfection; tepid fat penetrates everywhere, and does not cook at all, but actually prevents cooking. Any housekeeper who reads this, and chooses to profit by it, need never put any greasy, half-cooked and indigestible food upon her table. The whole secret consists in having the fat boiling before the things are put in. There is one other condition which follows naturally from this first one, which is almost invariably lost sight of even by good cooks, and that is that the fat should entirely cover the article to be fried. The reason of this is, that the part not at once covered by the fat remains cold, cools off the fat near it, and then absorbs the tepid fat just the same as if it had never been hot. Frying-pans should be deep, well filled and heated to the boiling point, and then it is easy to turn out fried food crisp, brown and dry on the outside, and perfectly soft, moist and well cooked within. It is a peculiarity of the outside crust of things fried in boiling fat that the fat itself drips off from it as readily as water; hence well fried articles are neither greasy in appearance nor very greasy in reality. Frying ought to be as easy as boiling.—*Christian Union.*

Indian Corn and its Uses in Domestic Economy.

A bushel of Indian corn contains more nutriment than a bushel of wheat; but Indian corn should not be ground fine, and it will not keep sweet. There is no grain that can be put to so many good uses and served up in so many different ways as corn end corn meal.

First, we have the green corn, roasting oar and soup in the early, and the dried corn soup and hominy the balance of the year. These dishes every good housekeeper knows how to prepare, being among the most simple in the culinary art.

And then by grinding it into meal, what visions of delicious eating float before our eyes. First, we have the corn cake, made of meal and water, and a little salt; if you are too poor to use eggs and milk, mix into a dough and bake on a griddle. Then corn bread or pone, which can only be made properly by about one housekeeper in ten. Then mush and milk and fried mush. We have never seen the individual that did not like one or the other. Many fail in making good mush by not boiling it enough. When it is merely scalded it has a raw taste. Then there is a very good corn meal pudding, made by stirring the meal into scalded skim milk till it is as thick as gruel, and when cool, add ginger, cinnamon, nutmeg, salt and sweetening to suit the taste, and a little fine cut suet and some raisins or dried peaches, and a fine cut apple. It should bake an hour or more, according to size. This is a good pudding. And then see into how many dishes corn becomes a palatable and favorite mixture. It is the cheapest and most wholesome food that man can live on, and should be on the table of both rich and poor more frequently than it now is, in some one of its many forms.—*Germantown Telegraph.*

A piece of red pepper, the size of your finger nail, put into the meat or vegetables when first beginning to cook, will aid greatly in killing the unpleasant odor arising therefrom. Remember this for boiled cabbage, green beans, onions, chickens, mutton, etc.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Reported Ascent of Mt. Whitney; Value of Foreign Patents; A Mining Scene, 129. The Filling Up and Cleaning Out of Modern Rivers, 136. The State Fair; Mexican Mines; Transportation and Freights; An Improved Portable Water-Heater; The Panamint Mines; Quicksilver, 137.

ILLUSTRATIONS.—A Hydraulic Mining Scene, 129. Gum Plants, 134. Woolsey's Portable Heater, 137.

CORRESPONDENCE.—Vienna Exposition; Notes of Travel in White Pine County, Nevada, 130.

SCIENTIFIC PROGRESS.—Chloral Hydrate; How the Duration of a Flash of Lightning is Measured, 131.

MECHANICAL PROGRESS.—Krupp's Guns; Testing the Quality of Iron; Granulated Iron for the Danks Puddler, 131.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 132.

MINING SUMMARY from various counties in California, Nevada and Arizona, 132-3.

USEFUL INFORMATION.—Cements; Iron and Steel in Early Times; Curious Instincts of the Bee; Fat Men; Insect School of Medicine, 135.

GOOD HEALTH.—The Human Windpipe; Carriage of the Body; Medical Uses of Charcoal; Excreting Powers of the Skin, 135.

DOMESTIC ECONOMY.—The Philosophy of Frying; Indian Corn and its Uses in Domestic Economy, 135.

MISCELLANEOUS.—How are the Deep Placer Mines of Plumas County to be Rendered Productive? 130. Gum Plants; How Salt is Made; Nickel, 134. Patents and Inventions, 137. Narrow Gauge Vindicated, 138.

HEAVY PAN.—The Gold Hill *News* says: "A huge cest-iron pan, for the reductiou of tailings, passed np Mein street, this morning, on one of Gallagher's big wagons, drawn by a crowd of horses. It was as large as a pig-pen, weighed over 13,000 ponnds, and was lebeled on its starboerd side, in big white chalk letters, "Seratoga Trunk." It was cast at the Gold Hill Fonndry, and hes gone to Parke & Bowie's mill, Six-mile Cañon. It is intended for three sets of mullere, and it is the heeviest pau of the kind ever cast."

THE White Pine *News* suggests that a Commission, consisting of say three persons, well versed in the busiuess of mining and judges of varions characters of ore, he appointed by the next Legislature to collect specimens from the numerous districts of Nevada, label them properly and place them on exhibition at Philadelphia during the coming Centenuial Exposition.

THERE is a uice little muss now on the carpet between *Engineering* and *The Engineer*, which calls forth some pretty sharp language. This is quite an innovation on the usual dignified indifference of the Euglish periodicals. We are too well used to that sort of thing this side of the water. Speaking personally, we don't fight when we can get out of it.

CANON CREEK, Trinity county, is oue of the prosperous mining campe of the county; the claims being marked are generally deep hanks of heavy gravel and red loam. The outlook for mining next winter seems very favorable.

A SLUTHOUR PUMP is heing worked by a donkey engine, on the Government lot, near the Post Office, for the purpose of freeing the excavation of water. We gave a detailed description of this pump some time since.

THE GOLDEN CHARIOT MINE in Sau Diego County has a ledge seven feet wide upon rock from which a mill is kept running night and day.

THE late rains in Arizona have given an impetns to placer mining there.

The Filling up and Cleaning out of Modern Rivers—Formation of Alluvial Bottoms—Great Tunnel Scheme, etc.

A good example of the manuer in which deep aud narrow ravines become filled up and finally couverted iuto alluvial valleys, and river hottoms, is preseuted at many points whsre hydraulic mining is now beiug prosecuted in Califiornia. One ot the most notahle iustances of of this kind is fouud along Bear river, and its principal trihutaries. For more than twsnty years these streams have heen the receptacles of the teilings from the rich and extensive mining regiou drained by them. Originelly they were steep and nerrow gorges, having, however, hut a moderate descent. Owing to this letter feature, the dsbris from the mines began early to make lodgement aloug them, so early thet much of ths auriferous grevel on their banks was covsred np hefore it could be washed; and only a comparatively small portion of their heds was ever worked out. In this respect these were different from most other strssms throughout the mining regions of Celifornia, nearly all of which have a steep greds. and consequently a swift current thet bears off the sediment bronght into thsm, and deposits it a long way below.

Effects of the Winter Freshets.

For some years at first the winter freshets sufficed to sweep away the greater pert of these tailings lodgsd here dur ing the rest of the seeson. But being afterwards augmented by the repid extension of ths hydraulic weshings they at lsngth accumnlated to snch a degree that a portion of ths lower stratum remained undisturbed, having psrhaps first ohtained a permanent foothold during an extremely dry winter. After this the greatest floods failed to clean out these streams altogether, ths ordinary winter freshets serving only to reduce the volume of their contents by carrying off the lighter and more worthlese material, while the coarser seud, gravel and shingle, including most of the gold end quicksilver, impacted into a solid mass, wae left behind. The highest stages of water occurring during the past twelve yeers heve been insufficient to ley bare their beds at more than a few places, nearly ell situated some distauce below the seat of active hydreulic operations. For a long time past these creeks and rivers have heen so filled up that the falls and rapids along them have completely disappeared, the gravel occupying their chenuels, aud which wes a descent of about 50 feet to the mile, heing graded as evenly as the bed of a railroad.

Wben left to the operations of natural causes the formation of tbese alluvial hottoms is conducted something after this manner. Floods occurring from time to time, hring down and leeve along the hanks of the streams a quantity of sediment. Having subsided, the redueed volume of weter mekes for itself a cbannel through thie sediment, keeping it till another overflow occurs, which mey aud often does fill up tbis chenuel, or wash out additional ones, meking, meeutime, new deposits over tbe entire face of the flat, or so much thereof, as mey heve been submerged. And so this procedure is kept up one year after another, until this alluvial wash accumulating gradually raises the surface higher and higher, aud enlarges the area of these valley lands till the passage way that the water has made for itself becomes so broad and deep that the stream seldom any more overflows its banks, end the process of land-making is arrested, or proceeds here very slowly, the great mass of the debris beiug thereafter carried on and left at points further down.

Action of Hydraulic Washings.

Where these ravines are filled np with hydraulic slums the mode of procedure is somewhat different. In extremely wet winters, the floods sweep away the top layers of gravel, lowering the surface from side to side but leaving the great hody smooth and uutouched. During the rest of the year the water, reduced to a comparatively small volume, runs iu a numher of shallow channels, which readily filling up with sand, clay and gravel, are ahandoned for new ones, and in this manner the entire surface of the deposit is gradually raised, heing at the same time kept at a uniform level. Sometimes as many ss half a dozen rivulets will be seen meanderiug aloug these flats with much scattered water flowing between them.

For the past ten or twelve years the annual increment of tailings in these streams has ranged from ten to thirty feet, while the reduction caused by high stages of water has gone on at about two thirds that rate. With dry winters their bulk has heen reduced hut little, while with extremely wet ones a large proportion of them has heen run out. Latterly the water has acted upon them with dimiuished force owing to their hecoming so much impacted and spread out over so great a surface.

Extent of these Deposits.

In linear extent the tailings occupy the bed of the main Bear river for a distance of more than sixty miles, reaching all the way from Elmnore Hill, a little above Dutch Flat, to the mouth of the river. In some places they ere not over 100 feet wide on the snrface, while at others, whers the river channel is spreed out or covss have been formed hy inflowing streams, they expaud to a width of four or five hundred fest. In depth they are equally variable, heing more than 100 feet deep at some places, while they ars not over 20 or 30 feet deep at others. Above Colfax, the section richest in gold, they are estimated to hava an average depth of 60 feet end a width of 200; this applying to Greenhorn Cañon, Steep Hollow, Missouri Cañon, and other tribntaries of Bear river as well as to the main trunk itself.

Auriferous Bottom Lands.

After leaving the foot-hills, Bear rivsr, like all the streams descending from the Sierra, flows with a less accelerated current aud through a brosder channel, whereby extensive hars and flats have been formed along it from these hydrenlic washings. As only the more comminuted particles of clay and sand have heen floated this far down, we have in these the elements for a good soil, portions of these new mede lends, as well as others adjacent, that have heen enriched by the overflows of Bear river, having been cultivated with success. Mingled with this saud there is of course a great deal of gold, nons of which can ever, perheps, be gathered with profit owing to its uupalpehle fineness and to its heing mixed up with such a disproportionate emount of harreu metter. Did the gold exist hers in much larger quantity and under otherwise more favorebls conditions it conld not bs collected to advantage by any of the msans or methods now in use, becanse of a lack of sufficient fall along this portion of the river to admit of sluics washing. As a rule, the fnrther we go hslow the mines the smaller the quantity of precious metal contained iu these slnms. Afisr leaving the vicinity of the large hydranlic claims the amount of free gold, as well as of quicksilver, amalgem, sulphurets and hlack send diminishes at the rate of two or three per cent. for every fivs milss we make down stream.

The Fatal Trouble to be Dealt With.

But much as ths tailings up uear the mines ahound in thess valuahle snbstances, the same trouhle is encountered here that confronts us further down, there heing a leck of snfficient fall to admit of uninterrupted sluics weshing on a large scale. Fortunetely, this difficulty is not irremediehle. The North Fork of the American River, seperated from Bear River hy a narrow divide, runs in a hed uearly 800 feet lower than tbat of the latter etream, rendering it possible, hy the construction of a tunnel through this divide, to pass these tailings out of Bear River and dump theu into the North Fork, where they can never more be the cause of any trouhle, the gold heing extracted from them while on their passage from oue stream to the other.

This project has been talked of and the necessity of ite execution long foreseen; hut not until the present eummer has any party determined to cerry it out practicelly. In the month of April last a company was organized in this city for the purpose of determiniug by careful examination the quautity and valae of tbese tailings, the proper site for a tunnel, the cost of its construction, outfitting, etc. After three months spent in the field, a corps of able engineers and experts, having reported favorahly on the scheme, hoth es regards feaeibility and resultant profits, this company will proceed at once with the work, the firet step heing to settle the style of drilling machine to he employed in driving the tuunel, in connection with which all needed drafts and surveye have heen made, and other preliminary work completed.

Quality and Value of Tailings.

According to the report of the Company'e Mining Engineer, there are 50,000,000 cuhic yards of these tailings now resting in the hed of Bear river, and its brauches ahove the site of the proposed tunnel, and all of which will have to he passed through it. These tailinge it is calculated will yield ahout 65 cents to the cnbic yard, making an aggregate product for the whole mass of nearly $30,000,000, aside from the quicksilver and sulphurets they contain. The quantity of quicksilver mixed up with this material is estimated at 400 tons, most of it existing in the form of amalgam. It is helieved the tunnel can be completed and the eutire work be outfitted and placed iu runniug order within eigbteen months from the time the machiue drills are set up, it being the intention of the engineer to drive the excavation from eight different faces—six from a shsft—and two inclines to he sunk along the line of the tunnel, and one from each end of it.

Character and Cost of Tunnel, Etc.

This tnnnel will he 12,540 feet long, will be 12 feet wide and nine feet high and will he run on a six-inch grade—that is, it will have a fall of six inches to every 12 feet. It will set in four feet below the hottom of Bear River and come out 300 feet above the North Fork, making a descent of 394 feet on its passage through the divide. The site fixed on for this tuunel is at Cape Horn, a noted locality on the Central Pacifi Railroad. A flume reaching from side to side will he laid down along its entire length. This will be paved with large cohble stones, except a few hnndred feet at the npper end which will he laid with hlocke. A similar structure will he laid down in Bear River through which to pass the tailinge, this being advanced up stream as faet these are rnu out. The principal gold saving apparatus will be placed below the tunnel along the North Fork, it being intended that this shall bs of the most ample and perfect kiud. It is the purpose of this company to seve everything of valne, the quicksilver end sulphurets as wsll as ths flour gold and hlack sand, to which end no peins or necessary expeuse will be spared. Ths flumes, gates, dems, &c, are to he built of messive timhers and to he auchored into the hed rock with iron holts in such a manner that no flood can move them.

It is calenlated that the

Entire Cost of this Work,

Tnnnel, flumes, gold saviug appliances, Etc., included, will amount to ahout $600,000, and that the gross annual revenues will bs abont one and a half milliou dollars for the first year, two and a quarter for the second, aud fonr and a helf for every yeer thereafter, this incrsased product heing due to the greater richness of the gravel as work is advanced up stream. It would require tsn years to exhaust the stock of material on hand if no accessions were meantims made to it. With new snpplies constently coming in it will reqnire nearly twics that time to approximately clean out these chaunels, there heiug, of course, no such thing as keeping them entirely free from tailings as long as mining itself is coutinned. There can, therefore, be an end of these operations only when the business of hydraulic washing shall itself ceass, au event not likely to happen in this century nor yet in the next. It is

Matter for Public Congratutation

That an outlet for these tailings is likely to be furnished at an early day, as they hed already accumulated to a troublesome extent and if suffered to go on unchecked, must have soon seriously obstructed many mines tailing into thess streames. Ths work is said to he iu excellent hands, the company haviug it in charge being mads up of some of onr most sterling bnsiness men, and of practical miners interested in the section of country to hs hsnefited by thsir proposed operetions. Thet the euterprise is entirely feasibls, admits of no douht, nor is there any qnsstion but it will prove immensely profitahle to those concerned in carrying it out.

THE HASKIN'S perjury snit which has attracted so much attention iu mining circles and has heen going cn for some time in Selt Leke City, has heen dismiseed. A dispetch from there, deted the 27th, says: The case of Col. Enoe A. Wall, upon the cherge of perjury preferred hy J. W. Haskin, which hee heen on hearing before Justice Clinton for several days past, was dismissed this afternoon, the Court fully exoneeting the accnsed hy saying in snbstence that the evidence showed that Wall'e teetimony hefore Judge McKean, which was the basie of ths charge, wes well founded end trne. This therefore, so far as the Justice's Court goee, establishee the fect that the famous Great Eestern end Great Western mining cleims in Little Cottonwood were mythical as to actuel locetion and development, aud have been hrought up epperently to devour the Hiawatha, Last Chauce, and other valueble minee in the vicinity. It will be remembered Haskin was first arrested et the instance of Wall for perjury in reference to the same metter, and is yet under hail of $5,000 to anewer.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco

SOUTH ALMADEN QUICKSILVER M. Co.—Aug. 21: Object, to work certain lodes and deposits of cinnahar and other precious metals in New Almaden Township, and to carry on the general business of mining and smelting. Directors—John Chapman, James A. Hale, John L. Armstrong, George G. Hoag and I. Bluxome. Capital Stock $3,000,000, in shares of $100 each.

POORMAN G. & S. M Co., Aug. 25.—Location: Owyhee county, Idaho Territory. Capital stocks: $5,000,000, in shares of $100 each. Directors: David D. Colton, Geo. W. Beaver, Mark L. McDonald, E. M. Fry, T. J. Shackleford. All the capital stock has been subscribed.

ANAHEIM WHARFING AND TRANSPORTATION Co.—Aug.: 26. Object, to construct and maintain wharves, docks, piers and warehonses at Anaheim Landing and at other places within the State of California, and to do a general wharfing, dockiug, warehouse and transportation business within the State. Trustees—Michael. Reese, John B. Felton, Ohadiah Livermore, Theodore Wetzel and James M. Taylor. Capital stock, $500,000, in shares of $100, of which $ 60,000 have been subscribed.

DELIA G. AND S. M. Co.—Aug. 27. Nevada county, Cal. Directors—Jacob Bachtel, James Colley, J. M. Hixon, J. F. Atwill, John W. Bucklin. Capital stock, $4,000,000, in shares of $100 each, of which $500,000 have been subscribed.

Meetings and Elections.

CLAY STREET HILL RAILROAD Co.—Directors: A. S. Hallidie, Jos. Britton, H. L. Davis, James Moffit, Robert Sherwood, Charles Kohler and William Sinon.

NORTH BEACH AND MISSION RAILROAD Co.—Directors: John Morton, James T. Boyd, Jerome Lincoln, Calvin Paige, Michael Skelly, J. C. Wilmerding, Michael Reese, and T. L. Barker. The company have paid ten monthly dividends during the year, each one-half of one per cent, aggregating $50,000.

CALEDONIA S. M. Co.—Aug. 20: Trustees—A. K. P. Harmon, (President); W. E. Dean, (Vice-President), W. S. Hobart, B. Peart and Martin White. R. Wegener, Secretary; A. C. Hall, Superintendent.

WARD BEECHER CONS. M. Co.—Aug. 19: Trustees—B, F. Sherwood, Camilo Martin, Wm. B. Bourne, H. G. Blasdel, Robt. Sherwood, G. Pinkham, J. E. de la Montagnie.

CEREBERG M. Co.—Trustees: N. W. Spaulding, (President,) Joh M. Seamans, S. G. Beatty, E. Lathrop, Jr., and E. Tripp. The mine turned out $74,000 in bullion during the past fiscal year, and paid $48,000 in dividends to stock holders. There is now a cash balance of about $5,000 on hand. The shaft has been carried to a depth of 200 feet, and a new level will he opened.

THE Hibernia mine in Cedar Valley District, Mohave Co., Arizona, is said to have heen sold to parties in this city.

The State Fair.

The grand agricultural carnival of California is approaching, and from the note of preparation heard on every hand, we are assnred of one of the most attractive Fairs ever presented in the United States; California, of all the States of the Union, has the means to make it so. Our stock breeders have ransacked the whole of the Western and Atlantic States to secnre the best blooded stock known to exist, and they have, without regard to cost, secured the best blood of the country, or of the world, and this stock will be on exhibition; inclnding horses, cattle, sheep, goats and swine, with fancy and sterling poultry in great variety.

In the department of frnits, the liberal premiums nffered by the society will call nut, we are assured, from the applicatioue made for room for display, a larger and finer exhibit of the leading varieties of the fruits of the fall season, than was ever made before. There are a large nnmber of visitors from the East, some nf them waiting pnrposely to see the exhibit, with the avowed object of making arrangements for the purchase of large quantities for the Eastern markets, if promising varieties are presented. This ought to stimulate our fruit growere to come on with their best frnits, and ehow the world what they can do. It will not be the quantity on exhihition, but the quality as adapted to ex port, with a statement of the quautity that ean be fnrnished, etc., that will tell.

Let those who have fine wines of California growth, bring them out; strangers want to taste them, and this is what we want; we want to get rid of them at remnnerative prices, eo that we will not have to drink them ourselvee. Persons having anything a little finer and hetter than can be grown or gotten up in any other conntry, ehould exhibit them for premiums and for sale, at the State Fair to he held at Sacramento from the 15th to the 20th of September, inclusive.

Mexican Mines. — Our old correspondent, "Valverde," of San Dimas, Mexico, sends ns a few items from that locality, as follows: "Lae Agnas (i.e. the rainy season) has finally set in, and we are practically eealed in for four months. Our supplies are laid in, however, and so let it come. The San Luis mine people have come on a fine hody of ore, and are taking out a few tons of $500-ore per day, and considerahle $140-ore. The Angusta Tunnel, for the Bolañoe mine, has resumed work, and they are driving it ahead rapidly. They have 700 varas to rnn, and will come iu 59 feet below the 'Planes' of the miue, or 631 feet deep. The entire tnnnel will he 393 feet in length.

The Solidad mine, the Gnadalnpe mine, of Tayoltita, and San Rafael mine, of San Vincente, are doing well. Mining is looking up in these camps, and the starting-up of an American stamp mill, of Capt. C. B. Dahlgren's, has started every "Buscon" in the count:y to hnnt for ore. Henry Janin has lighted on a good thing here, and so has F. Snndell, of Mariposa. Thirty tons of $250-ore come out per week, eo far, and the production will be increased as soon ae eeveral old mines are pumped out, and hoisting-works put in others, or tunnels finished, etc."

The Panamint Mines.

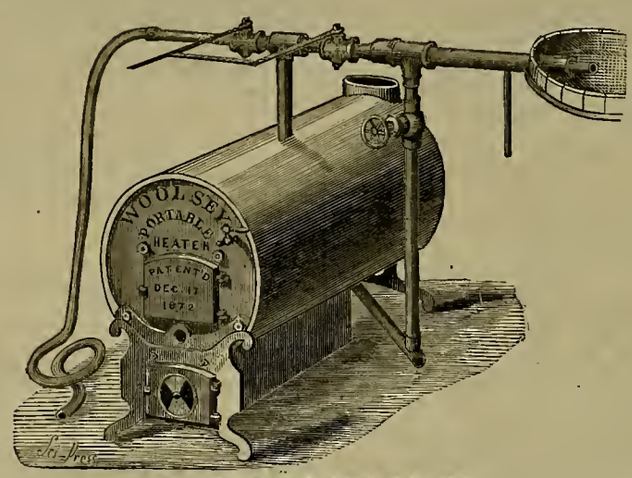
N. D. Christie writes to us from the Panamint mines, saying that he has made a carefu examination of most of the principal mines in that newly discovered helt of silver-hearing veins, and is fnlly convinced that many of them are valuable, and that this new mining region ie deetined to pay a large trihute of wealth to the conntry. He is fnlly satisfied that the "Wonder of the World" is a very valuahle mine. Thie mine in many placee ie from 20 to 25 feet in thicknese, and at least 6 feet of it will pay upwards of a hnndred dollars a ton. It will furnish plenty of good ore to keep a 20 stamp mill running for years. There is plenty nf wood and water here. Natnre has indeed heen generous in her henefactions, and favored the region with uot only rich and extensive miues of silver and lead, hnt with evcrything necessary to work them. As the place progresses and the mines become developed Mr. Christie will keep us posted.

Dr. A. K. Stearns, a vigorous prospector from Butte county, has discovered a very promising lode of galena. The lead ie about 4 feet in thickness, and will average 60 per cent. in lead to the ton. R. C. Jacobs, who is a very intelligent miner and a good metallurgist, is firm in the helief that the miues of Panamint will eurprise the world.

An Improved Portable Water-Heater.

The accompauying illnstration represents Woolsey's portable water-heater for domestic purposes. It consists mainly in a novel method of cnntructing the heater, and nniting the different parts eo thst it ie easily made tight without tbe use of joints. The outer shell of the boiler is made light, as it ie not required to etand mnch pressure; the inside ehell forms the fire box. The two shells are brought together at their lower edges, and at this point are united by rivets, leaviug an open space over which the grate liee. A pipe rieee from the top of the boiler and branches off as showu. These branches have cocks wbich are connected by levers, so that when one is opened the nther will be closed. Oue of theee branchee leads off tbe heated water tbrough a hose or hy other means. Tbe other branch leads out a short distance to the bottom of a harrel or tank. This branch leading to the tank is a douhle pipe, oue inside the other. The outer or larger pipe conducts the cold water into the hoiler, uuder it, and the smaller pipe carries the water, after it is heated, back into the tank, if it is not desired to draw it off. Tbe larger pipe takes the cold water from the bottom of tbe tank, and ae the emall pipe dischargee the hot water, it naturally rises to the top.

Whenever tbe water is heated in the hoiler, and when it is not needed for heating purposee, a circulation will be kept np hetween it and the tank so thst all the water will become heated and when, by reason of uee, tbe water



WOOLSEY'S PORTABLE HEATER.

in the hoiler is lowered, that from the tank will flow in and take its place. Ae this water is already heated, no cessation of the work need result. It affords a convenient method of utilizing the waste heat and preventing any accumulation of pressure within the hoiler. The whole device is cheap and effective, and would be very ueeful on farms for many purposes. On dairies, in particular, where hot water is needed so mnch, a emall machine like this would he invaluable. John S. Woolsey, of Gilroy, Santa Clara County, Cal., is the inventor.

Cleaning Quicksilver—"Valverde" writes ns from San Dimas, Mexico, and describes a method he has adopted for the purpose of cleaning quicksilver, which may he useful to some of our readers. He eaye: "I place 1,000 pounds of quicksilver in a hasin, and force nothing hnt cold or warm water through it from helow, and any grease or foreign matter is carried off. Any 'sick' mercury or calomel is also taken away. It is a cheap and useful method, and will keep mercnry nice and clean for any length of time. If one has not eteam power, etc., water may he led in pipes, and with the proper fall will answer. I have nsed it for aeveral years. The 'Mercury Pot,' as I call it, has a cock and valve to draw off the clean mercury. Care must he exercised not to force the water too violently, so as to cut up the quicksilver too much, and so carry off finely divided particles."

Ore shipments from Little Cottonwood last week were greater than for any other week this season. Six of the principal mines aggregate over 2,000 tons. It is estimated that there are hetween 3,000 and 4,000 tons on the dumps, Reports from other districts in Utah indicate a like improvement.

Transportation and Freights.

We puhlished in our last issne the circnlar issued by Senator Casserly, stating that the Sub-Committee of the United States Senate, which is empowered to inquire into the facilities for transportation by rail and sea, would meet in this city, to begin its husiness in relation to the Pacific Coast. Senators Casserly and Mitchell are the members soliciting the information relating to this coast. Senator Mitchell, of Oregon, being detained at home through sicknees in his family, the duty devolves upon the California Senator. On Tuesday last, Mr. Casserly met the committee appointed hy the Chamher of Commerce to confer with him, and during a preliminary conversation amongst them, one of them asked Mr. Casserly if Congreas could regulate these matters. Senator Casserly said this was a perplexiug question, and one that meu were afraid to face, although all were deeply anxious on the point. The Senator produced certain docnments arranged for statistical information, which he eaid it would be desirable to nave filled up. The headings of these documents were: "Average rate of freight on wheat from San Francisco to England, each montb dnring the last five yeare from 1868 to 1872, inclnsive." "Shipmente of wheat from San Francisco each month during the last five years, from 1868 to 1872 inclusive." "Average price of the leading grade of wheat at San Francisco, each montb dnring the last five years—1868 to 1872, inclusive." "Receipts of wheat flour, corn, rye, oats and barley at San Francieco, for fifteen years—1858 to 1872, inclusive."

He had eent a circnlar to the Farmers' Granges all over the State, eo far as he could ascertain them, and aleo to the newspapers in thie State, Oregon, and Nevada, defiuiug the nature of the inqniry, eo that pereous desiring to fnrnish any information would know what to do. It was desirable that persons who had any information to fnrnish should commnnicate with them as soon as possible.

At the meeting Mr. Capp was appointed to collect statistical information. During the proceedings the fact was developed tbat the Virginia and Truckee railroad, 52 milee long paid a profit of $40,000 per mile, per annum, being its entire cost. Freight from here to Reno was a cent and a quarter per pound.

Mr. Casserly read a printed document of the Senate, ehowing that the inquiry covered all means of transportation to the seaboard from the interior, thue embracing almost every deecription of route, and in reply to Capt. Eldridge he etated that the inquiry would also relate to the traffic with China and Panama, and up and down the coast, and with the Sandwich Islands. He expected to get answers soon to the circulars sent into the interior, and he believed a great deal of information could he ohtained in San Francisco. The meeting was only a preliminary one and adjourned subject to call of the chairman.

The Shipments of throngh freight eastward over the Central Pacific Railroad for the six months ending June 30, 1873, were, from San Francisco, 23,899,435 pounds, and from Sacramento and otber interior points, 2,655,032 pounds, a total of 26,554,367 pounds, or 1,328 car loade. The shipment for the eame period iu 1872 were 31,034,056 pounds and in 1871, 23,797,703 pounds, showing a decrease this year from 1872 of 4,479,689 ponnds, or 14 7-16 per cent., and an increase over 1871 of 2,756,675 pounds, or 11⅝ per cent. The principal items of freight in 1873 were: wool, 13,700,057 ponnds; tea, 2,927,434 pounds; coffee, 1,835,588 pounds; wine, 1,632,724 pounds; flour, 1,543,250 pouuds; leather, 776,321 pounds.

The digginge at Spanish Camp, Grant County, Oregon, fnrnish employment for 20 white men and a numher of Chinamen, who are makiug fair wagee.

Patents & Inventions.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., August 26th, 1873.

For Week Endinn August 12th, 1873."

Fastening for the Meetinn Rails of Sashes. Myron Gee, Oakland, Cal.

Dredginn Machine.—Albert Boschke, S. F., Cal.

Fauit Box.—Chas. W. Weston, S. F. Cal.

Hay and Grain Unloaden.—Wiuford J. Webber, Hollister, Cal.

Elevated Wire-Way.—Carlos E. W. Bnnster, Valparaiso, Chili.

Cookinn Furnace. — Henry Englemann, Salt Lake City, Utah.

Cookinn Furnace.—(Same ae above.)

Car-Couplino.—Richard B. Buckner, Gilroy, Cal.

State Fairs.

We have compiled the following list nf State Fairs to be held tbie year which will he neefnl to many of our readers for reference:

American Pomological Society, National Exhibition of Frnit, annual fair at Boston, Septemher 10, to —.

New Hampshire Ag. Aesociation, at Manchester, Sept. 30th.

New York State Ag. Society, 33d annual fair at Alhany, Sept. 24th to Oct. 1st.

Pennsylvania Hort. Society, annual exhihition, Philadelphia, Sept. 15th to 19th.

Northern Ohio Fair Association, annnal meeting at Cleveland, commencing Monday, Sept. 29th.

Ohio, Mansfield, Sept. 1st; Nehraska, Lincoln, Sept. 1st; Iowa, Cedar Rapids, Sept, 8th; Indiana, Indianapolis, Sept. 10th; Des Moinee, Des Moines, Sept. 16–4; Illinois, Peoria, Sept. 15th; Michigan, East Saginaw, Sept. 15th; Wisconsin, Milwankee, Sept. 22d; Kansas, Topeka, Sept. 22d; Miunesota, St. Paul, Sept. 23d; Montsna, Helena, Sept. 29th; Northern Kansae, Atchison, Sep. 8th; Cincinnati Exp'n, Cincinnati, Sept. 3d; Kansae City Exp'n, Kansas City, Sept. 15th; Missouri, St. Louis, Oct. 6th; Arkansas, Little Rock, Oct. 13–5; Georgia, Macon, Oct. 27–5.

California State Ag. Society, annnal fair at Sacramento, Sept. 15th to 20th.

The State Vine Growers and Brandy Makere' Association join tbe State fair ae nsual.

San Joaqnin Valley Ag. Society, annual fair at Stockton, Sept. 30th to Oct. 3d.

Santa Clara Ag. Society, fair at San José, Sept. 22d to 27th, inclusive.

Northern District Fair, annual fair, Maryeville, Sept. 8th to 13th, inclusive.

The Upper Sacramento Valley Agricnltnral Society's Fair, at Chico, on the 22d, 23d, 24th, 25th, 26th and 27th of September.

Santa Clara Valley Agricultural Society, at San José, Septemher 22d, 23d, 24th, 25th, 26th and 27th.

Santa Cruz District Fair, Soquel, time not fixed. The Santa Cruz *Sentinel* says: We learn from Mr. John S. Mattison, President of the Connty Agricnltural Club, that a County Fair will he held this fall in Santa Cruz, and that a committee has heen appointed to cousider time and place, ways and means, etc., nf holding the fair.

Napa and Solano District, annual fair, Vallejo, Sept. 9th to 13th, inclusive.

Sonoma and Marin District, annual fair at Petaluma, Oct. 6th to 11th, inclusive.

Contra Costa County Fair, annual show at Pacheco, Sept. 22d to 26th, inclusive.

California Farmers' Union hold their annual meeting and election of officers at Sacramento, September 17th, 1873. All the Farmers' Clubs and Grangee of the Patrons of Husbandry in the State are entitled to send delegates. One delegate for every ten members, and one additional for every fraction of that numher over half.

The Yellowstone Expedition ie having a little Indian fighting hy way of variety, and the extensive preparatious made for resisting them have heen fully justified. Several hattles have heen fought, hut the Indiane were whipped eaoh time. At one time a party of 800 Indians made an attack but lost ahout 40 of their numher. Over twenty of our men were wounded and three were killed.

Arizona wants more good practical miners and less specnlators without means. She wants men of meaus, and no mining experts, prophets or wiseacres. If Arizoua gets more men of means and practical miners than she wants, there is plenty of room for the surplus eupply elsewhere. She is not aloue in her "wants" for her needs are identically those of much older mining States and Territories.

The Carson Mint employe 50 pereons, seven of whom are women. The dishursements at the mint fnr lahor and material amount to about $10,000 per month.

Narrow Gauge Vindicated.

For the past few years no snbject, perhape, has excited more discussion in engineering circles than this vexed one of the proper width of rsilroad tracks. Argnments have been advanced on either side, broad and narrow, in overwhelming profusion, without leading to oonviction in case of a member of the opposing faction, so far as we know. The narrow gange party, on the one hand, have succeeded in proving to their own sstisfaction at least that the general system and rolling stock of the majority of existing roeds are cumbrous, expensive aud obsolete; while the wide gauge advocatcs have decided the revolutionary eystem to he slow, insecure and pnerile in character. But actnal experiment is whst has been needed, to prove comparative merits and demerits, and experiment on a large scale, in order that deductions made from it may be general. This practical experience has at least heen had in the case of the Festiniog railway in Wales and the Denver and Rio Grande R. R. of our own conntry. Several less important lines have been constructed on the narrow gsnge plan; we propose now to consider only the qnestions involved and points demonstrated in the very snccessfnl rnnning of the Denver and Rio Grande road, as collected from the late most interesting report.

The company saved about 37½ per cent. in the first ccst of construction and equipment of its road hy reason of the adoptiou of a gauge of 3 feet instead of 4 feet 8½ inches. This is a clear saving, hecanse the road is eqnally well hnilt in every respect and its capacity as great as thongh it had heen of the wider gauge. The passenger cars have proven comfortahle and at least as steady in riding as those on the wider roads, and the freight cars have carried satisfactorily all classes of traffic, hulky and concentrated. There has been no accident on the road, and the centre of gravity of the cars is so mnch lowered that one conld hardly occur that would he traceahle to the gauge. In addition to first and second class passengers, the road has carried dnring the past year freight of great variety in character. Beeidee heavy articles,—coal, ores, stone, lumher, iron, hardware, grain, etc.,—it has carried wool, furnitnre, hay, wagons, and other freight of the lightest and most bulky natnre; while, of conrse, on this last class, the henefit derived from the gange by the saving in dead car weight has not beeu so great, yet there is no class of freight npon which the proportion of paying to non-paying weight has not been in favor of the narrow gauge as compared with the wide.

Freight Cars.

With conceutrated or hcavy freight, which constitntes on this, as on nearly all railroads, the great bnlk of the tonnage to he transported, the advantage realized has been 35 per cent. That is to say, thirty-five hnndredths more freight has been regularly carried on the narrow-gange rolling stock, with the same total weight of cars aud load as on the broad-gauge. This can he most readily seen by observing a trsin of 16 loaded cars (which weigh say 8½ tons each when empty) arriving at Denver on the broad-gauge roads, and their contents transferred to the Denver and Rio Grande Railway. The same freight is placed in 20 narrow-gange cars, the empty freight of which is somewhat leas than 3 tons each. But it very often happens in the ordinary conrse of railroad business that cars are very freqnently not loaded to their capacity, in which event the narrow-gange receives a proportiouately greater henefit. For instance; if from any station there was a load of hut 5½ tons to carry, the narrow-gauge car would weigh no more with this load than the broad-gauge car wonld, entirely empty.

The narrow-gauge cars are not too light to atand the rough nsage for any lengtb of time; becanse, as all the other cars on the road are likewise light, they are not subjected to any more momentum or crushing force in proportion to their strength than a wide-gauge car is where all are heavy; and further, it is a well known fact in mechanics, that small structnres are much stronger in proportion to their weight than large ones. The cars have proved large enough to carry even the most hulky kinds of freight, such as wool, furniture, etc. Cattle and horses can he carried and although the road is not yet constructed sufficiently far sonth to obtain mnch cattle business, yet in time this may he looked for as furnishing a large traffic, and the road is preparing for it. The stock cars already bnilt are 6½ feet wide. 28 feet loug, weigh 8500 pounds, and carry nine head of cattle. The animals stand lengthwise with the car, which is hetter for them than sidewise, as they can steady themselves more readily. The dead weight of car to on animal is in the case of the wide-gauge, 1357 lbs., aud narrow-gauge, 844 lbs.

But for short cattle the cara are wide enough to carry the cattle in the usual way, in which case the narrow-gange car carries 13 head of cattle, or withiu onc of as many as the broad-gauge.

Passenger Cars.

The cars are comfortahle, well ventilated, handsomely fitted np, and the 25,000 passengcra who passed over the road last year certainly rode as steadily, and, as far as could be jndged, altogether as satisfactorily as ou any wide-gauge road. As far as space is concerned, the whole passenger travel of Europe is carried in compartment cars, practically lesa roomy and not nearly as well ventilated. The first-class cars seat 3 passengers across the width of the cars,—two on one side of the aisle and one on the other,—an arrangement which, by increaeing the proportion of naesengers who can have seats by themselves and adjoining the window, makes it mnch easier to fill all the seats.

Even three seats are not occupied on the average in wide-gange cars. A certain nnmher of passengers are acquainted, and wish to sit side hy side; others prefer to he alone. It is difficnlt hy supervision to stow away passengere as one wonld freight: the traveler taking one eeat, and his carpet-hag the other, thns preventing intrusion. The car adopted hy the company appears to suit the average conditions of travel oetter than one of either two seats or four.

The first-class narrow-gauge car ie 7 feet 2¾ inches wide inside; 35 feet 4½ inchee long, weighs 7½ tons net, and seats 36 passengers, —an average of 417 ponnds of car-weight to one passenger. The broad-gange day-car weighs 19½ tons, and can seat 56 passengers, —an average of 696 ponnds of car-weight to one person.

Sleeping Cars.

Sleeping cars are nsed with mnch greater advantsge than on the wide gange, becanse although people unknown to each other can generally with some effort he made to sit on the same seat, they cannot well he made to sleep in the same bed. The practical result is that the traveler pays for two beds and the railways carry the extra weight and width for two heds to one person. So it happens that while the present Pullman car weighs from 25 to 30 tons, it carries on an average but 15 customers. The Denver and Rio Grande Company has not a length of road sufficient to reqnire night travel, hut when it has, sleeping cars will he introduced which will weigh less than 10 tons aud accommodate 20 travelers. The conches will not be so wide as to allow the sleeper to roll nneasily with the movement of the train, bnt instead of paying for two berths he will pay for hut one. They will be every whit as comfortable as those on the wider gange, and still leave ample space for the aisle. When a single person wishes, as freqnently happens,—especially in the case of ladies,—to take an entire section, he will pay for two berths only, instead of fonr, as at present.

Speed and Safety.

It is to be hoped the good sense of the lines will prevent any general increase in their speed, at least to any extent; hut trains have heen run during the past year ou the Denver and Rio Grande Railroad at 30 and even 40 miles per hour, and it is impossible to see why they cannot, if it hecomes necessity, increase their present rates as readily as on tbe wide gange.

As regards safety, the cars are no more likely to npset thsn on the wide gauge, becanse the centre of gravity hae been greatly lowered. This is confirmed hy the year'e experience on the road. A car on the wide gange road, it is true, he made considerably wider than it commonly is without this danger, hut that would reqnire a hroader and costlier road, and in the practical transaction of the carrying trade the nnit of the grsss bnsiness, the car-load, has proven to he already to lsrge. It wants to be reduced rather than he enlarged. There is one respect in which the narrow-gauge car is nndoubtedly eafer to travel in than the wide gange,—that is, in the rednction of the momentum, wbich is the measure of the difficulty of stopping its headway in case of danger, as well as the concussiou in case of colision or heing thrown from the track. To carry 100 passengers on a narrow-gange road, the weigbt of the cars alone would he 18 tons, instead of ahont 36 tons as on the broad gange, consequently the momentum at the same speed wonld be bnt little over one-half.

A positive advantage is claimed from the rednction of the carrying capacity of a car below what it now is on wide-gauge roads. It so freqnently has to go partially loaded in the practical, everyday working of the bnsiness that it wonld he hetter if it were smeller. It is well known how rarely a passenger car is fnll; although capahle of seating 56, the cars probably do not average in the Unted States over 25 passengers to the car. In the heavy Pnllman car it is but 15. It is the aame with freight to some extent. The railroads in the United Statea carry at least fonr times aa much total weight yearly as of freight load. If the car nnit were smaller, mucb nnnecessary hauling would he saved. For local trade especially, which constitutes the bnlk of hnsiness on almost every American railroad, a great advantage wonld be gained, saving time, side-track room, hesides dead weight. The capacity of the narrow-gauge car even exceeds the average actnal load of the broad-gange car.

[To he continued.]

A New Oil.—In Tsuknmaken, Japan, a new way of making oil has been annonnced. By taking the waste cocoona and the chrysalids of the eilkworms (which are nsually thrown away after being taken ont of the hot water) and pressiug them, an oil is ohtained, which is fit for use after standiug ten days. About one hnndred and sixty-five pounds of these yield nearly fifteen pounds of the oil, which is said to hurn well in lamps. If thia be true, and can be practically and nniversally accomplished all over Japan, it will cause a new branch of industry to spring np of auch proportions as are not to be despised.—*Jour. of Applied Science.*

THE latest reports from the London coal market show the following qnotations: Hawthorne, 26s. 6d.; Lamhton, 28s. 6d.; Sonth Hetton, 29s. In 1869 the amount of coal conenmed in London alone was 5,133,667 tons; in 1870, 5,579,671 tons; in 1871, 5,810,789 tons; and in 1872 it was 5,900,690 tons. Taking the population at fonr millions, the average consumption per head was one ton, nine cwt., two qrs., dnring last year. In this calcnlation the term London inclndes what is known as the London Metropolitan district, taking within its scope nnmerous manufactories of all kinds, thus largely increasing the amount of coal nsed heyond the ordinary requirements of the city proper.

MINING DECISION.—The Commissioner of the General Land Office decided on the 21st inet., hat the adverse clsim of the "420" Mining Company to the application of the Bullion Company for a patent on the Comstock lode mnst be adjudicated in the conrts hefore the patent issnee to the Bullion Company.

THAT FAVORITE HOME REMEDY,

PAIN-KILLER,

Hae heen hefore the public over THIRTY YEARS, and prohahly hae a wider and hetter repntation than any other proprietary medicine of the present day. At thie period there are but few unacquainted with the merits of the PAIN-KILLER; hnt, while some extol it ae a liniment, they know hut little of its power in easing pain when taken internally; while others use it internally with greet anccesa, hut are equally ignorant of its healing virtues when applied externally. We therefore wish to say to ell, thet it is equally successful, whether used internally or externally. It is sufficient evidence of its virtuee as e etandard me licine to know that it is now used in all parts of the world, and that its sale is constantly increasing. No curative agent haa had such e widespread aale or given each universal satisfaction.

DAVIS' PAIN-KILLER is a purely vegetahle comhound, prepared from the hest and purest materiels, and with a care that inenree the most perfect uniformity in the medicine; and while it is a most effective remedy for pain, it ie a perfectly safe medicine, even in the most unskillful hands.

It is eminently a FAMILY MEDICINE; and hy heing kept ready for immediate reort, will save many an hour of suffering, and many a dollar in time end doctor'e hille.

After over thirty yeare trial, it ie etill receiving the most unqnalified teetimonials to its virtnee, from perecna of the highest character and responsihility. Eminent Phyeicians commend it as a most effectual preparation for the extinction of pain. It is not only the hest remedy ever known for Bruises, Cuts, Burne, etc., hut for Dysentery, or Cholera, or any eort of howel complaint, it is a remedy unsurpaseed for efficiency and rapidity of action. In the great cities of India, and other hot climatea, it haa hecome the etandard medicine for all such complainta, as well as for Dyspepeia, Liver Complaints, and all other kindred disorders, For Conghs and Colds, Canker, Aethma, and Rheumatic difficnlties, it has been proved by the most ahundant and convincing testimony to he an invaluahle medicine.

We would caution the public againet all imitatione of our preparation, either in name or style of putting up.

Valuable Mill and Mining Property

IN NEVADA,

To be Sold or Leased,

EITHER TOGETHER OR IN PARCELS.

The whole of the magnificent properties lately held by "The Nevada Land and Mining Company, Limited," consisting of:

THE AUBURN QUARTZ MILL, near Reno, Nevada, on the C P. R. R., run by water power, containing twenty stamps and a Stetefeldt Furnace, free of royalty; also, the necessary offices, storehouse, stables, and manager's and workingmens' houses.

The first right to the water of the Truckee River, more than sufficient to run 100 stamps, and forming the most valuable mill site in the State of Nevada. The canal is about four miles in length, and is used also for irrigation of land and the supply of water to the town of Reno and vicinity.

800 ACRES (about) of FERTILE LAND adjoining the town of Reno, partly laid out in town lots, and a considerable part of which has been under cultivation.

THE ALPHA MINE, at Rye Patch. This mine adjoins the well-known "RYE PATCH MINE," has been well developed, has produced large quantities of rich ore; and is considered, in every respect, equal to the Rye Patch Mine.

THE WHITMORE and NORTH SHEBA MINES, which adjoin the De Soto Mine, near Star City, Nevada, and controlling interests in three mines in the Pinto District. Ore of considerable value has been obtained from these last named mines, and they show fine indications, but they have not as yet been fully developed.

The exclusive right to grant licenses for the use of the STETEFELDT FURNACE for the county of Humboldt, Nevada, and one-half of the royalties payable in respect thereof.

The above properties constitute one of the most valuable mining and milling investments ever offered to the public.

The Mill is in good running order, and has the well-earned reputation of working ores (especially those of refractory character) to a higher percentage than any other mill on the coast.

Tenders for the purchase or lease of the above properties, or any part or parts thereof, may be addressed to

MR. WILLIAM A. STORRY,
Occidental Hotel, San Francisco.
W. S. GODBE, Esq., Salt Lake City.

PROPOSALS FOR

MATERIAL and WORK

FOR A PORTION OF THE

NEW CITY HALL

AND

HALL OF RECORDS.

OFFICE OF THE BOARD OF CITY HALL COMmissioners, corner Leavenworth and McAllister streets, San Francisco, August 14, 1873.

SEALED PROPOSALS.

For Furnishing certain Material and for doing certain Work for a portion of the New City Hall and Hall of Records, will be received at the office of the Board until 12 o'clock noon of **Friday, the 19th day of September,** A. D. 1873, as follows:

1—BRICK-WORK—Bricks laid in the wall, with Facework extra, and Setting Blocks, Keystones, Capitals, Springing Blocks, Iron Plates, etc., and providing and setting Iron Bonding and Arch and Chimney Bars, etc.

2—STONE AND STONE WORK—Granite Blocks, Keystones, Capitals, Springing Blocks, Stone Cressing, Internal Granite Columns of Hall of Records, etc., provided and worked.

3 IRON WORK—Wrought Iron Girders for Third Floor, provided and set.

4—IRON WORK—Cast Iron Columns, Girders, Lintels, Brackets, etc., for Hall of Records, provided and set,

5—IRON WORK—Dome of Hall of Records, complete.

All according to specifications, plans and drawings to be furnished by the Board.

The expenses of advertising will be charged pro rata to the successful bidders.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,
Board of City Hall Commissioners.

The California Powder Works

No. 314 CALIFORNIA STREET.

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS, It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the NEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

Artificial Ice.

Ice-making by this direct action of heat can hardly he described as a novel process. For many years past ice has been mads by the application of the well-known principls that compressed gases extract heat from surrounding objects, and, passing off in vapor, may bs condensed and nsed ovsr again without appreciahle loss. In the well-known ice-machine invented by the late Mr. Daniel Siehe ether was uaed as the heat extractor, and nearly-frozen hrine circulating around tanks filled with cells containing pure water solidified the contents into slahs of pure ics. Since the succes of the ether machins a uew process has been invented, which, althongh apparently more complicated than the ancient method, has the advantage of exceeding cheapness. Mr. Reece's system produces cold by hoiling a strong solution of ammonia. The vapor is dsprived of watery particles and passss into a coil whereiu it is rendered liquid by th' pressnre of its own weight alons. Collected within a refrigerator, ths condensed gas ahatracts the heat from the contents of a worm filled with a freezing liquid of cold carrisr. Ths liquid employed for this pnrpose is a vast improvement on the old-fashioued hrine, inasmuch as chloride of calcium can be brought to a temperaturs of 50 degrees below zero, without congelation. This chloride of calcium is simply made to flow into tanks containing the object to be frozen, or through pipes destined to cool the surrounding atmospheres. So little coal is required to hoil the solution of ammonia, and so accurate is the adjustment of ths machins to prevent waste, that fine, pure ice can be produced at the cost of five shillings per ton. We are informed that the long-standing objection to machine ice, on the scors of cloudiness and general opacity, can now he overcome by the employment of larger plant and slower production; but inasmuch as ths consumption of clear ics is only 10 per cent. of ths total amount absorbed, the question of opacity is only of minor importancs. Quick freezing shuts in the air, and the rapidity of production is, in some measure, compensated by the less sightly and attractive appearancs of the ics, but, aftsr all, the production of artificial ice is only ous of the objects to which a cold-producing machine may he applied. Brewera and hutchers reqnire artificial cold for cooling wort, or preserving beef, and manufacturers of chemicals, distillers, and bacon curers also find their account in the institution, known in ths United Statss as a "cold room." The application of cold to the hold of a ship, at a slight outlay, affords a hops that Australian and Texan meat may at last reach our shores in perfect condition, and that the application of chlorids of calcium as a freezing liquid may produce happier results than the employment of the same liquid in cooking Australian beef. One uss of thia system of diffusing cold occurs to us as likely to provs of great sanitary importance. In the atokeholes of steamers, a stream of cold air would be of almost incalculable value.—*Iron.*

— THE Pensylvania R. R. Co. have at Philadelphia the largest round house in the United States. It haa 44 tracks, and accommodation for as many locomotives.

Leather Market Report.

[Reported for the PRESS by Dolliver & Bro.]

The Leather trade remains in the same continned state of dulness. Generally this time of the year is one of considerahle activity, while November and December are considered the months of greateat dulness. Perhaps this state of things may he reversed this year. There seems to be every probability that such will prove the result. The indications at present are of improvement, and business is a trifle stronger, as more money is changing hands just now, on account of advances made on crops. Prices, however, remain precisely the same as reported last week.

GENERAL MERCHANDISE.

Provisions generally are very firm. There is a fair demand for all kinds of Cured Meats. Oase Goods have been sold in some quantity at reserved prices. Refined grades of Sugar are in active demand. The large arrivals of Bags and Bagging of late have rather overstocked the market. Prices of Soap remain unchanged. The price of Coffee has advanced on an average 1c in New York. This is made the occasion for a similar rise here.

San Francisco Metal Market.

WEDNESDAY, Aug. 27, 1873.

The sales this week have been somewhat more frequent, though complaint is still made in this as in other departments of trade. In this connection we notice that cargoes of Pig have actually been shipped from Marquette to England. There has been much wild talk about supplying the English market, but facts have hitherto been wanting to substantiate the vague assertions. Shipments have also been made to British Colonial ports.

Though it will he long hofore we can hope to supply England, there is no doubt but that her foreign and Colonial export trade will he materially supplanted. This does not, of course, affect our market perceptibly as yet, though in time the influence must he felt.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may he quickly fastened and retained in hook form at the end of the volume, and the hinder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can he used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS,

1amhp

THE Mining and Scientific Press,

Started in 1860, is one of the oldest weekly jonrnals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly o.largsd and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other puolishers have accumulated on this coast, of a weekly journal.

The sum paid hy us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIO journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

PATENT SELF-CLEANING SLUICE.

This new and useful invention is designed to collect all the gold as fast as it is set free from the dissolving earth, and conduct it into a receptacle of mercury or safety pocket, under lock and key, from whence it may be removed in a few moments, without either checking the flow of water or interfering in the least with the washing.
The invention, if properly placed in our rivers, will also collect the gold which is yearly traveling down their channels, thus affording an annual income with a trifling expense for attending.

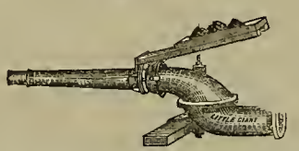
Machinery.

TO HYDRAULIC MINERS.



I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.
His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.
The Machine itself is also an infringement on another patent owned by the same parties.
All persons infringing on either of these patents
WILL BE PROMPTLY PROSECUTED.
I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.
I Guarantee Full Indemnity to all my Customers.
Machines of all sizes always on hand.
If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.
For further particulars apply to
R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, Oakland,
Or WILLIAMSON & CORY, Marysville.

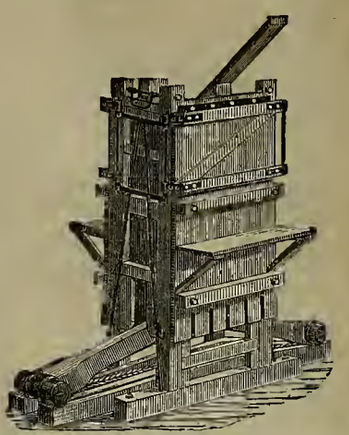
THE EAGLE HAY PRESS.



The above is a correct representation of this remarkable EAGLE HAY PRESS, the invention of J. A. McGillivral, of Illinois, to whom Letters Patent were issued Jan. 10th, 1855, and July 24th, 1866.
Several years were devoted by the patentee to the perfection of this powerful press, and its unprecedented sale in the East induces the proprietors to introduce it into California and the Pacific States.
All who have seen or used these presses pronounce them superior to anything used heretofore. The power is applied by means of two levers, and it will be seen the power increases in ratio to the resistance, as the levers approach a horizontal position the power can scarcely be estimated. It is not only a powerful press, but has the advantage of being cheap, and also simple, therefore not liable to get out of order.
Three men with one horse can bale from TEN TO FIFTEEN TONS PER DAY, each bale weighing 250 to 300 pounds. It obviates all necessity of beating the hay before pressing. On account of its great power it is well adapted for pressing HYDES, RAGS, WOOL OR COTTON. When a bale is pressed and fastened the follower runs down of its own weight, and the bales can be taken out on either side. On April 18th, 1871, this Press was tested at the State Agricultural Hall, Sacramento, and stood the test of a bale of wool, 550 pounds. Reference, Maj. Rob't Beck.
We have added to this Press this season an improvement (patented) which does the stamping, dispensing with men to tread down the hay in the Press, facilitating the operation, and saving much hard work. The additional cost being but $25, paying for itself in labor saved in a week.
These Presses are now manufactured in San Francisco by the

Kimball Car and Carriage Manufact'g Co.,

Who are the Proprietors on the Pacific Coast, and will endeavor to have a supply constantly on hand.

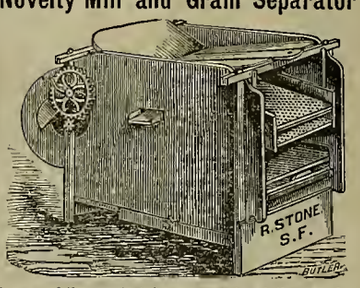
THE PATENT
Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.
For further information apply to
R. STONE,

CALIFORNIA INVENTION.

CALL AND EXAMINE.

For Sewing Machines, Dentists' and Jewelers' Lathes.

This Invention can be applied to the operating of all kinds of Sewing Machines, Dentists' and Jewelers' Lathes. Its simplicity is only equaled by its durability; it avoids the use of the treadle, which is ungraceful and injurious.

Application made by the Agents for the Pacific Coast.

SAWYER & WHEDON,
1v6eowbp 633 Washington street San Francisco.

BURLEIGH ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Opsratss as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

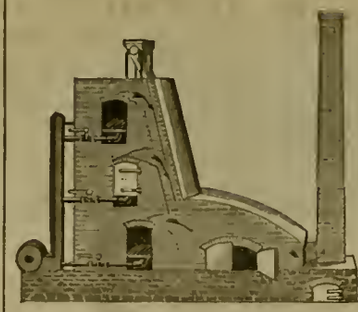
25 Bond street, New York.
Platinum Scrap and Ore purchased.

EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in his superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

THOS. McGLEW & CO.
Austin, Nev., July 15, 1873. 6v27-tf

OAKLAND

SMELTING AND REFINING CO.

Is now ready to receive Lead Bullion and separate the Silver and Gold therefrom, and Refine the lead on reasonable terms, and have the same ready for delivery within thirty days from its receipt.

Their works are situated at Melrose, on the line of the Railroad, three and a half miles easterly from Oakland.

The Bullion will be received at the works, directly from the cars, free of expense.

Valuable Mill and Mining Property

IN NEVADA,

To be Sold or Leased,

EITHER TOGETHER OR IN PARCELS.

The whole of the magnificent properties lately held by "The Nevada Land and Mining Company, Limited," consisting of:

THE AUBURN QUARTZ MILL, near Reno, Nevada, on the C. P. R. R., run by water power, containing twenty stamps and a Stetefeldt Furnace, free of royalty; also, the necessary offices, storehouses, stables, and manager's and workingmens' houses.

The first right to the water of the Truckee River, more than sufficient to run 100 stamps, and forming the most valuable mill site in the State of Nevada. The canal is about four miles in length, and is used also for irrigation of land and the supply of water to the town of Reno and vicinity.

800 ACRES (about) of FERTILE LAND adjoining the town of Reno, partly laid out in town lots, and a considerable part of which has been under cultivation.

THE ALPHA MINE, at Rye Patch. This mine adjoins the well-known "RYE PATCH MINE," has been well developed, has produced large quantities of rich ore; and is considered, in every respect, equal to the Rye Patch Mine.

THE WHITMORE and NORTH SHEBA MINES, which adjoin the De Soto Mine, near Star City, Nevada, and controlling interests in three mines in the Pinto District. Ore of considerable value has been obtained from these last named mines, and they show fine indications, but they have not as yet been fully developed.

The exclusive right to grant licenses for the use of the STETEFELDT FURNACE for the county of Humboldt, Nevada, and one-half of the royalties payable in respect thereof.

The above properties constitute one of the most valuable mining and milling investments ever offered to the public.

The Mill is in good running order, and has the well-earned reputation of working ores (especially those of refractory character) to a higher percentage than any other mill on the coast

Tenders for the purchase or lease of the above properties, or any part or parts thereof, may be addressed to

MR. WILLIAM A. STORRY,
Occidental Hotel, San Francisco.
W. S. GODBE, Esq., Salt Lake City.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found **more economical, advantageous and reliable** than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah. Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 28, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,

113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

SAN FRANCISCO, SATURDAY, SEPTEMBER 6, 1873.

VOLUME XXVII. Number 10.

An Improved Coal Screen and Chute.

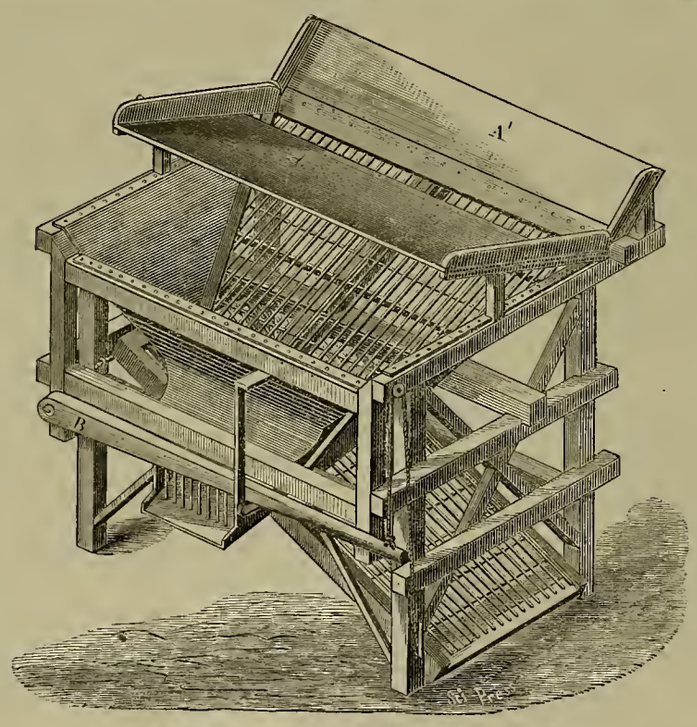
The usual method of discharging ships of their cargo of coal is to raise the coal from the vessel in tubs, by a steam hoisting apparatus, and dump it in a pile on the wharf. It is removed by carts to the different coal-yards, where it is screened so as to separate the screenings from the largo and more marketable portion. This plan necessitates considerable handling and shoveling, adding each time to the expense, and has many other objectionable features. Martin R. Roberts, of this city, has perfected a device which accomplishes the screening and loading at one operation, and as it has been working successfully on our wharves for some time, we have made an engraving of it for the benefit of parties who are unable to witness its operation.

The invention consists of a portable apparatus, having a double hopper, chute and screens, so arranged that by dumping the coal or other substances to be handled, from the tub into the upper hopper, the fine portions or small particles will be separated in two or more grades from the coarser portions, and be deposited in separate piles; while the coarser pieces are caught in the second hopper, from which they can be conveyed through a chute into the carts which convey them to the coal yards; thus requiring but one operation to discharge the cargo, screen the coal and load it into carts. The manner of construction of the device is easily seen. It is built in a strong frame, properly stayed and braced, and on one side of the top of the frame are two boards, *A* and *A'*, in the form of a trough with the lower ends separated. This is the upper hopper. The board *A'* forms an extension to one side of the large hopper, which is located in the body of the frame, below the upper hopper. This side of the large hopper slopes toward the opposite side of the frame, and is made of parallel wires, which form a screen over which the coal must pass in descending, leaving the large pieces on the screen, while the smaller particles fall below. This lower hopper is contracted toward its lower end, and a chute extends from it as shown. A gate serves to retain the coal in the chute until it is desired to allow it to pass from the chute into the cart. The gate consists of a lever bar *B*, which has one end pivoted to the frame, so that it extends across the end of the chute; metal teeth extend downward, as shown, across the mouth of the chute, so as to bar the entrance. By raising the free end of the lever the coal slides out into the chute.

An independent screen of finer mesh than the upper screen, is secured in an inclined position in the frame below the upper screen, so as to receive the particles of coal or other substance which pass through the upper screen. This serves to again separate the coal into two grades. The larger particles falling on this independent screen slide off to one side of the apparatus, and the finer stuff falls through on to the wharf or floor, directly under the frame. Two or more of these screens can be used, and the size of the meshes can be varied according to the substance to be cleaned, and the number and quality of the grades into which it is desired to separate the substance being discharged.

The frame may be mounted upon small wheels so that it can be moved from place to place on a wharf, in order to be put in position to receive the discharging cargo of several ships; but when moving from one wharf to another, axles are placed across each end of the frame on which wheels may be placed so that the entire machine may be drawn along similar to any wheeled vehicle. The upper trough, which is formed of the boards *A A'* is as long as the machine, so that in dumping the load, any vibration of the tub will not cause the load to be discharged outside of the hopper as long as the machine is properly located and ordinary care is exercised in dumping it. This form of the upper hopper also allows the substance which is dumped into it to spread over a larger surface and thus be more thoroughly screened than when the hopper is smaller. When it is not desired to screen the article or substance to be unloaded, a false bottom is placed upon the grating of the larger hopper so that the substance will be carried directly through the chute into the wagons.

It will be seen that by this arrangement coal can be discharged from ships, screened and loaded into carts not only at a great saving of time and expense in handling it, but with less wastage, as the large and more marketable pieces or lumps will not be broken when



AN IMPROVED COAL SCREEN AND CHUTE.

dumped in this machine as they always are when dumped from the hight of twenty or thirty feet upon the wharf or coal pile. All shoveling is done away with, except the light screenings which fall upon the wharf. A number of these machines are now in use in this city and give perfect satisfaction. In fact, all the coal used here is now dumped into these machines from the ships or lighters, screened and hauled away.

Heavy Bullion Shipments.—Eureka exported in one day, August 24th, 125,445 pounds of bullion. This is over 60 tons of bullion in one day. The *Sentinel* says at ten tons to the car load—the maximum tonnage of broad-gauge cars—it gives a train of six cars, with 772 pounds to spare. If shipped on narrow-gauge cars the length of the train would be doubled. Or to ship the same amount on mules—200 pounds to the animal and allowing each ten feet of space—it would make a train over a mile and a quarter long.

The shipment made on the 29th, however, beats this, being 173,589 pounds, the largest ever made from the district in a single day.

The Patent Congress.

The Vienna Exhibition, it seems, is destined to produce a result which the inventors of the United States and portions of Europe have long looked for.

The Patent Congress, which met at Vienna on the 4th day of August, has now before it a series of resolutions, which, if they are accepted by the various countries of the world, will assimilate our patent laws, protect inventors and provide easy, just and necessary rules for the future conduct of international patent matters. We have received, through our Prussian agents at Frankfort on the Main, a number of resolutions which it is proposed to present to the Congress for action, and after a careful examination we are prepared to endorse them fully, and believe their adoption would result in great benefit and advantage to the inventors of the entire world. We append a number of resolutions which have been presented and recommended by a committee appointed for the purpose of examining into the matter and submitting the result of the labors. The resolutions have been adopted by the Congress essentially as presented.

First.—Only the inventor himself, or his legal successor, shall obtain a patent. The granting of a patent cannot be refused to foreigners.

Second.—The duration of a patent for an invention is to be for fifteen years, or a shorter term, with the option of extending to that period.

Third.—Complete publication of patent to be obligatory.

Fourth.—The expenses of granting a patent to be established at a moderate but progressive scale. The amendment proposed by an American delegate to introduce a graduation tax on patents according to the condition of each respective country, was withdrawn, after repeated votes had been taken.

Fifth.—A specification of all patents in force must be accessible to the public.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last, Professor Davidson in the chair. Dr. Horatio S. Gates was elected a life member and Messrs. Andrew F. Craven and John T. Brady resident members. The following donations to the cabinet were received: *Octopus Punctatus* Junior of Gabb presented by H. Chapman. This was a specimen of Victor Hugo's devil fish, small enough to be placed in a quart bottle, but perfectly formed. A blue shark caught in the bay was donated by Mr. Throckmorton, one of the State Fish Commissioners. Capt. McDonald, of the steamer "Newhern," sent a bottle of water from the warm springs at Point Isabel, Sonora. Mr. Henry Edwards gave several specimens of snakes and a wasp's nest containing wasps (prepared) from Vancouver's Island. Mrs. Henry Edwards presented also a small snake killed by herself. The President showed some specimens of fine white sandstone from Merced Lake, which is being used for polishing purposes extensively.

Mr. Edwards stated that during his recent trip in British Columbia he had made extensive entomological collections and was preparing some 500 or 600 specimens to present to the Academy. Mr. Edwards is engaged on a work concerning the butterflies of this coast and their food, and requested any of the members who had made any observations on the subject, particularly the varieties of plants on which they feed, to favor him with what information they could.

R. E. C. Stearns made a few remarks concerning the fossil tooth from Santa Rosa Island presented some time since by Mr. W. G. Blunt. It is interesting and important as showing the island to be of a different geological age than is generally supposed. The fossil was found *in situ* and is not a drift specimen, which is proved from the fact that near by was found the tusk of a species of elephant which was so decayed that it fell in pieces in the attempt to get it out.

Professor Davidson, since the last meeting of the Academy, had inspected the partially exhumed remains of a large animal near Lake Merced before referred to by Mr. Hanks. The deposit had been suspected to be the bones of a whale, but he did not agree with that opinion. It was suggested that other members, better qualified for determining the character of the bones, should visit the locality.

The President stated that the Trustees had had under advisement the questions arising from the terms of James Lick's gift to the Academy, and had addressed to that gentleman a letter embodying their views. It is necessary to obtain some modification of the terms in order to be able to collect the money necessary to build and maintain the structure. At present the conditions are so binding that it is impossible to make any headway. The building is to be so large and built in such a manner that it will cost an immense sum to construct it. The Academy desire Mr. Lick to remove some of the restrictions so that the size of the building may be reduced, some of the rooms rented if necessary, and that the sum of money required to be on hand before the building is commenced be lessened. Mr. Lick has as yet made no specific reply to the letter, but there is reason to hope that he will modify some of the terms.

Only 60 or 70 carloads of ore per day are now being sent over the Virginia and Truckee Railroad to the mills on Carson river. The water is so low in the river that scarcely any of the mills are being worked up to more than half their capacity. The working force of most of the leading mines will have to be reduced materially for this reason. The *Appeal* says, the Merrimack is running very light—barely in motion—on tailings. The Eureka is running thirty stamps and five pans; the Mexican twelve stamps and four pans. Empire, in consequence, has taken a trip up the flume to abide until the Winter's flood.

[By Our Traveling Correspondent.]

Ely District.

This district is in Lincoln county, Nevada, 275 miles southeast of Palisade, on the line of divergence from the C. P. R. R., and is distant from San Francisco 848 miles, divided as follows: From San Francisco to Palisade, 573 miles, all rail, fare $38; from Palisade to Hamilton, 125 miles, fare $25 hy Woodruff & Ennor's Concord coaches; from Hamilton to Pioche, 150 miles, fare $30. Total cost of trip, $93; time occupied in transit, three days, ten hours, from San Francisco to Pioche. Meals average 75 cents each; run from 50 cents to $1. Currency is as good as coin in payment anywhere east of the line of California. Prominent among the stage men of Eastern Nevada, are Travis & Co., proprietors of the stage line between Hamilton and Pioche, carrying the United States mails and Wells, Fargo & Co.'s express. The Travis brothers of this firm, have spent the best part of their lives on the frontier, and though having to associate with the roughest element in the country (from the nature of their calling), they are both gentlemen of refined taste and business culture. E. J. Travis resides at Hamilton and attends to the business of this firm in general. Mr. W. S. Travis is the present Sheriff of Lincoln county, Nevada, resident at Pioche. His election to this position, by a very handsome majority over his competitor, against the natural politics of the county, shows his popularity, And although he is Sheriff of one of the worst cutthroat districts to-day, on the Pacific Coast, he is just as safe in the performance of his duties as if he were in the most peaceable community, for there are at least 500 men in Pioche that would risk their lives to save his. This company brings into requisition about 200 head of horses, and employ five drivers. They are also the proprietors of the stage line from Hamilton to Shellburn, via Mineral City, (Robinson District) a distauce of 95 miles; fare $12.50. Two drivers are employed on this route, and 45 horses are in use. You stop over night at Mineral City, distant from Hamilton 45 miles; fare $7.50.

Pioche Cily,

The county seat of this county, is located in close proximity to the mines of Ely District, at an elevation of 6,200 feet above the sea, and contains about 4,000 inhabitants; it is considered by the business men quite dull at present, owing to the unsettled state of mining titles—mines at law, and lying idle, employing hut few men, and purchasing but a small amount of supplies. Siuce my visit one year ago to this place, I noticed double the numher of fireproof buildings, and at least ten times as many families, showing a much better state of society. There are some 40 mercantile firms doing business here, hut a majority of their purchases are made East, at Chicago, St. Louis and New York, all owing to the inconsistency of your husiness public of San Francisco adhering so tenaciously to a metalic currency. They have heen sowing the wind for the last ten years, and now they are reaping the whirlwind. The mines of this district and snrrounding districts never looked hetter for permanency, hut the fear is that the legal gentlemen will get all that has heen taken out, and leave the owners of stocks without means to go on. There are no hotels in Pioche; it consists of lodging houses, and restaurants, the former chargiug from 75 cts to $2 per night for lodgings, all of which are about the same quality; the restaurants charge from 50 cts. to one dollar per meal. In this particular, there is a marked difference; the Star Restaurant kept by an old Californian, Mr. W. Stansfield, is the best place in Pioche for a fine meal, located on upper Main St.

The Raymond & Ely S. M. Co.

On my visit to this celebrated mine I was shown around the works above ground hy the ohliging and gentlemanly Superintendent, Capt. H. H. Day; hut owing to the present state of affairs of this company in equity, I was not allowed helow ground. They had just completed their fine hoisting works when I visited the district, which are seeond to none outside the Comstock mines for strength, heauty or capacity, a description of which I believe you copied from the Ely *Record* which was very truthful. I will not reiterate, hut add that they have introduced the Stevens oxyhydrogen flame; it is being attendcd to here by Mr. Rollin, the agent, and as far as I can learn it gives perfcct satisfaction, claiming to save 25 per cent. of the fucl used in the ordinary way. The roof of this company's new boisting works is covered with tin taken from fruit cans. The joh was done by contract at $12.50 per square of 100 square feet, one dollar less than the cost of wood shingles in this section. The company are working in all departments about 250 men. The main shaft, the Lightner or Panaca shaft, is now down 850 feet, at which point they are running their 9th level. Between the 7th and 8th levels, a few days hefore my visit (Aug. 15th), they struck some pretty fair ore with a strong prospect of its continuing down into the 9th level and even lower.

The Meadow Valley Co.

Are working about one-half the usual force, extracting some ore. Their deepest shaft is down about 1,000 feet. J. C. Maynard, Esq., is the Superintendent of this company. I am unable to give any particulars in regard to this mine, other than as ahove stated, owing to the close corporation principle of many companies heing operated upon in your stock boards. Even statistical information is not ohtainahle outside of what the ore pays. It may not be generally understood that the mines of this district are perfectly dry. The nearest water obtained in this district is in a well 180 feet deep, located at the Four-Mile House, 1,010 feet below the Lightner shaft of the Raymond & Ely mine. It is supposed that all the mines here in Pioche will, at a depth of 1,200 feet, strike water.

I will add as an opinion of my own that at a depth of 1,200 to 1,500 feet, all the dips, spurs and ledges, within two miles of Pioche will be one ore hody. My reasons are, after visiting a majority of them, that as all the ledges lying on the north of the main belt are gradually getting flatter in their pitch to the south, reducing the pitch at a depth of 500 feet, from 70° and 80° to from 35° to 40°, and all those located on the south of the main belt are hecoming more vertical, standing from 80° to 87°. When that time occurs (and I think it will) there will be employment for all the attorneys on the coast.

Washington and Creole Mine,

Superintendent, Martin Tarpey. This company are developing their mine hy an incline shaft, now down 640 feet, on an incline of ahout 75°. The hoisting works are excellent, with strength to develop to a depth of over 1,000 feet. The shaft is in two compartments, and timhered from top to bottom. The hoisting works cost something over $25,000, besides two tanks with capacity to hold 16,000 gallons of water, that cost ahout $1,500 more. The company have drifted ahout 300 feet upon their ledge, which at the present depth ohtained, is about 15 inches in average thickness. Last month they reduced 300 tons from this mine that paid $31,500, and they claim to have 350 tons more upon their dumps, of the same class of ore. Working 45 men in extracting ore, and further developing the mine.

Pioche Phœnix Silver M. Co.

This incorporation claims 1,000 feet of location; located hetween the Page & Panaca, anp the Raymond & Ely mines, 225 feet of which, on the east end of their claim, are claimed by the Hermes S. M. Co., and also hy the Raymond & Ely S. M. Co. As to the legal owners of this small, though very valnahle piece of mining ground, I have nothing to say, as the courts have the affair in charge, and will in due time, I dare say, settle to which company or corporation it does helong. Suffice it to say, that there are very excellent hoisting works upon this mine, run hy an engiue of 60 horse power, erected over their dcvelopiug shaft, which is down 500 feet vertically. It is in two compartments, 4x4 feet each, and timhered from top to hottom. The ore hody in this mine runs east and west and dips slightly to the sonth, say at ahout 80°. The shaft is soutb of the ledge, and has two levels run in to tap the ore body, ono at a depth of 400 feet taps the ledge iu 75 feet, running north, the other, run from the bottom of the shaft (500 feet deep) taps the ledge at a distance of 25 feet, running to the north. At the points where the drifts iutersect the ledge, it shows an ore hody of 3 feet in thickness. As the ahove mentioned work is on ground disputed at present, they are running a drift from the bottom of their maiu shaft to the northwest to tap the ore body heyond the disputed grounds which will be, when completed, about 25 feet from the main shaft; twelve men are employed. There is some ore on the dumps from the old working of last year, hut none from the new. John Nelson is the General Superintendent, and D. N. Jackson, Mining Foreman. This is among the most promising mines of the district.

Chapman Mill and M. Co.,

Situated between American Flag and Huhn and Hunt. Shaft 420 feet deep. The depth of the first level is 170 feet. Considerable ore is exposed. Betweeen second and third levels some 200 tons of ore have been mined and worked. At the third and fourth levels the ledge is broken and ore of low grade. At the fifth level (or 470 feet) the drift has cut the ledge and the character of the ore has changed, heing free and of better quality than in any of the upper levels. From indications they have sunk through the harren portion of the ledge, and have cut the top of the ledge in a new formation.

The officers are, President, D. L. McDonald; Secretary, Frank Swift; Superintendent, J. B. Daytou. They are hoisting by a whim.

Louise Silver M. Co.

The Anna Dickinson, Eliza Grattan, and Ellen Goodspeed claims form the consolidation. Work for the present is confined to the Anna Dickinson, a location of 400 feet, easterly about 800 feet from the Burke shaft of the Raymond & Ely. Shaft 200 feet in depth. At a depth of 78 feet, a drift has heen run on a ledge of narrow but high grade chloride ore. At present runniug drift on 200-foot level for the ledge. Feeders have heen cut, and the ledge, from all indications, is near at hand. The Grattan and Goodspeed, 1,000 feet each, are distant some 2½ miles westerly from Pioche. The Grattan shaft, 50 feet in depth; ledge wide and well defined. The ore, low grade, gives average assays near the bottom of the shaft, 45 feet. The ore has much improved in the last 15 feet—a mere trace near the surface. Goodspeed shaft is 75 feet deep; sunk on ore vein from surface; vein narrow, ore good quality. The ore vein can he traced for 400 feet on the surface, four to six inches in width. President, J. A. Pritchard; Secretary, W. H. Watson; Superintendent, J. B. Dayton.

Mazeppa Mine.

This mine is situated on the northwest slope of Spring Mountain, nearly due west from the American Flag mine, and in line with the Flag and the famous Panaca lode. The prevailing opinion in the district is that there is an orehody cutting through the mountain from east to west; and the developments made in the Panaca, Newark, Yolo, Mazeppa, Arkansas and Flag,—all nearly in liue, and all developing ore,—strengthen the opinion.

The Mazeppa was located in December, 1869, and contains 1,000 feet. It was incorporated in December, 1872, with Henry Raymond as President, W. H. Raymond, G. M. Dobin and others, Trustees. The stock has never heen placed on the market, the Trustees preferring to make further developments before placing it on the Stock Board. The mine has two shafts —one a prospecting shaft, ahout 180 ft. deep; the other, the working shaft, 350 to 400 feet deep, is now heing sunk and thoroughly timbered. The mine has excellent steam-hoisting works, with capacity for working to the depth of 1,000 feet. The machinery and everything ahout the mine is in perfect order and working smoothly.

From $10,000 to $15,000 worth of ore has heen taken from the mine, in sinking and working the prospecting shaft, the last lot of ore milling $237 per ton. The ore is a rich chloride, and at a depth of 150 feet the vein shows strongly, between well-defined walls. The company is sinking their main shaft rapidly, work heing prosecuted night and day. The mine is very highly esteemed in the district, and we shall before long expect to see it sending its bars of bullion to market.

Pioche Silver M. Co.,

An incorporation, prominent among the mines of Ely District, is being operated on your San Francisco Stock Exchange Board. John Nelson, Esq., is Superiutendent and P. J. Cullen, Mining Foreman. In my letter of Sept. 7th, last year, I gave your readers an extended account of the different dips and angles of this mine. I stated at that time that it was being developed through a vertical shaft, then 460 feet deep, and through five different levels, run south to the ledge. The same is the case at this writing, and the main shaft is no deeper. The development siuce my visit a year ago has been principally to the eastward, and by an incline sunk ou the dip of the ledge at a point on the fifth lovel, 266 feet from the bottom of the vertical shaft. The ore hody runs nearly east and west and dips to the south at an angle of ahout 60°, down to the fifth level; from this point the ledge becomes more flat, so that this latter incline, in following the ore body, dips south at an angle of only ahout 45°. The formation of the country rock in the mine is quartzite down to about the 4th level, or 360 feet from the surfaco. From this point it is principally shale, with an occasional bunch of quartzite, down to the present workings which are about 558 feet vertically from the surface. The ore now heing extracted from the miue is from the first and second lcvels. About five tons of first, and three tons of second class ore, are being extracted daily. The company are working regularly 41 men in all departments. They are directing their attentiou to sinking a new shaft, located 475 feet south of the present one and about 200 feet east of their west line, adjoining the Meadow Valley Co. This shaft is vertical, and at prcsent down 175 feet. It is being sunk hy contract, at $11 per foot. Tho shaft is in two compartments, (4x4½ feet in the clear) and will he when completed 900 feet deep, at which point they expect to strike the ore hody, and will if the ledge continues with the same dip as last indicated in their incline, sunk from the bottom of the 5th level in the old works. They are having their ore now worked at the Condor or Amador mill, three miles from Bullionville. The Bowery mill nsed to do their crushing, previous to its heing burned down in September last. The hullion product of this mine from March 31st, 1872, to March 31st, 1873, was $219,767.23, from 1,994 tons of ore, averaging $110.21 per tou. Tho assay value per ton was $157.83—worked to nearly 70 per cent.; assay value, showing the tailings to have contained $94,948.72. Since that date 286 tons of ore additional have been worked, yielding $25,384.04, or about $88 per ton. Tbere are now on this company's dnmps 50 tons of first-class, and about 400 tons of second-class ore. The tailings have heen carefully saved, and economy generally observed at this miue, notwithstanding two assessments of $1 each have heen levied during the last year, aggregating $40,000. In August last year, a dividend of $1.50 per share, aggregating the sum of $30,000, was paid.

L. P. Mc.

[To be continued.]

NEARLY all the Mansard roofs in the Boston burnt district are constructed of firo proof material, either of irou, brick or stone. The brick Mansards present a fine contrast in color with the facades, and give a real Parisian appearance.

Edible Starches.

An interesting paper on "The Edible Starches of Commerce; their Production and Consumption," was read a short time since hy Mr. P. L. Simmonds at a meeting of the London Society of Arts. The lecturer pointed out that while the English use but one word to define all sorts of starch, even the minor classifications of arrowroots, sagos, tapiocas, corn-flours, &c., the French have two words by which they distinguish the starch obtained from roots, stems, fruit, seeds, etc., from the amylaceous product obtained from cereals: the former they term fecula, and the latter they define as amidon or starch. The value of the edible starches imported into England, which was in 1860 206,438*l*, in 1870 amounted to 366,570*l*, and in 1871 to 485,706*l*. The production of European starches was shown to be trifling as compared with that of tropical and sub-tropical countries, though considerable quantities are manufactured in this country from imported maize (or Indian corn) and rice, aud sold under the name of corn-flour. The island of St. Vincent is the only arrowroot-producing colony that has kept steadily progressing, the quantity exported to the United Kingdom having increased from 11,436 cwts. in 1863, to 16,919 cwts. in 1870. In 1850 the shipments were only 3,573 barrels and 7,493 hoxes. The other West Indian Islands, though at one time exporting considerable quantities of arrowroot, have gradually decreased their production, and the quantity exported has in every case hut that of St. Vincent dwindled down to a merely nominal figure. In Brazil considerable attention is given to the production and manufacture of edible starches. A large and varied collection of these was shown at the Paris Exhibition of 1867, comprising starches made from pumpkins, maize, bread-fruit, white and yellow manioc, Brazil potato, Demerara potato yam, banana, etc. A variety of the manioc or cassava, from the tubers of which feculas are mostly manufactured, the *Maranta arundinacea* was introduced into India about 1840, and is now cultivated to a considerahle extent, the arrowroot made from it being extensively used in India, and some of it shipped to Europe. The consumption of sago in the United Kingdom is stated as 52,000 ewts. in 1850, 179,825 iu 1860, and in 1870 the aggregate of sago and tapioca received from Singapore was 344,000 cwts., representing a money value of £283,541. The Australian colonies were also noticed hy Mr. Simmonds as arrowroot producing counties, specimens of this starch manufactured in the colonies having been exhihited at the Paris Exhihition of 1867, and the London Exhihitiou of 1872. The Pacific islands appear to be very rich in the fecula producing aruma and other plants, and a considerable trado is carried on in various feculas in many of tbe islands. Africa also shares to a considerahle extent in the production of arrowroot, hut Cape Colony and Natal are the only two districts that export it in any quantity. The *Maranta arundinacea* is the species cultivated, and it has also been introdnced into the Mauritius, whence specimens of arrowroot were sent to the Paris Exhihition of 1867.

The Extension of the Signal Service to the West Indies.

The puhlic will be glad to learn that the long-projected extension of the Weather Bureau to the West Indies is about to be practically realized. It is in the waters of the West Indian Archipelago that are annually formed those terrible tornadoes which desolate our Gulf and Atlantic sea-board and have always been the terror of navigation. The Signal Office, stretching out its lines of meteorological sentinels, as is now proposed, will occupy stations at Havanna, Santiago de Cuha, Kingston (Jamaica), Porto Rico, St. Thomas, Antigua, Guadeloupe and St. Vincent, in the Windward Islands, and thence hy the lateral cahle from St. Vincent to Barbados it will plant its extreme outpost at this latter Island. Barhados lies in the best possihle position to fnrnish the earliest premonitions of tbe hurricane which is on its way to ravage tho sea-coasts of the United States. At most of the West Indian islands the terrihle roar of these revolving storms can he heard ofton while yet the gale is a whole day distant. But at Barbados, although this island was the scene of the historic storm of 1780—known as "The Great Hurricane"—it is so near the cradle of the cyclones that they have seldom acquired violence enough to be audible as they approach its sontheastern shore. While in the Carribbean sea these fearful meteors have an enormous speed of rotation, hut the speed of translation which they attaiu is happily hut very small, and never more than twenty miles an hour, and seldom half as much as that. There is, therefore, generally a period of several days intervening hetween the passage of the cyclone over the Windward Islands and its arrival on the Gulf or the Sonth Atlantic coast, in which the Signal Office can give ample warning, hoth hy mail and telegraph.—*New York Herald.*

THE iron trade of this country employs 137,545 operatives and a capital of $198,356,116; the lumber trade, 163,397 operatives and a capital of $161,500,273. These are the most important branches of manufacture in the country, cotton, machinery and woolen coming next, in the order named.

AN inexhaustihle quarry of mill-stone, closely resembling tho French burr, has beeu discovered on the North Santiam, Orogon.

Scientific Progress.

Treatment of Metals and Ores.

Pagen and Roux propoo tbe following general metallurgical process: Alkaline oxides, hydrates or carbouates act upon tho metals or oros which thsy transform into hydrates. The alkaline bath, in fusion, provokes the successivo oxidation of the oxidisable metals, and permits their separation from tboso less oxidisable. Tbo metals are attacked in the following order: 1, arsenic; 2, mauganese; 3, zinc; 4, tin; 5, iron; 6, relybdenum; 7, tungsten; 8, chromo; 9, cobalt; 10, uickel; 11, antimony; 12, copper; 13, cadmium; 14, bismutb. Tbe three last mentioned metals are only oxidised hy the contact of air or tho addition of an oxidizing agent to ths alkaline bath. Lead, mercury and silver aro not sensibly oxidised, except sometimes indirootly. The metals 1 to 9 oxidiss themselves in presonco of alkaline carbonates, which thoy render caustio, giving off at the samo time carbonic oxide. All metals of tbe series decompose alkalins hydrates, oxidising themselvce, giving of hydrogon gas and replacing tho water off the hydrate in variable proportions, tho excess of oxide remaining in suspension.

On blowing steam into an alkaline hath, the water which has been decomposed is restored, and the action continues as long as tho bath remains sufficiently fluid. In liko manner the authors force currents of air into the melted metal to promote oxidation and desulphurisation or to attack lead. They sometimes add nitrats of soda to ths alkaline bath to conclude tbs operation. A remarkable reaction is produced when a current of steam is passed into a mixture of alkaline carbonatoa and hydrates. The carbonates are rendered caustic. To extract the precioua metals from pattisonised lead it is melted with its own weight of alkaline flux, and a current of compressed air is forcsd in till the metal contains 25 per csnt. of ths precious metals. This enriched portion is separately treated in the same manner, and ths operation terminated by the addition of nitrate of soda. Tbe slag, on treatment with water, yields a deposit of oxido of lead and a solution of plumbats of soda containing ons part oxids of lead to thirteen of soda. It is evaporated and servss for future treatments.

The authors point out the application of their process to the purification of zinciferous and antimonial leads, tho argentiferous dross derived from tbs zincage of workable lead, the treatment of argentiferous coppers, and ths manufacture of alkaline chromates.

Speakino of that strange anomaly, the educated man of the pheriod, who doubts the spericity of the earth, and is ever and anon making his appearance in print, *Iron* says: There is to be for our snlightenment a "New Geographical Society," whose main object is to maintain that the earth is not a sphere, but a plane surface. In the prospectns, which with a few otbsr documeuts has reached us, we are informed, as a gravs scientific fact, that "indisputabls flats can be shown along ths margin of every ocean, lake, canal, or river in the world," but whether the new society is to be constituted of such "flats" is not stated. That eminent man of scisnco, tbe Shah of Persia, is dragged in to serve the cause, and we are invited to share his astouisbmeut (but when or where expressed we know not), "that a nation which makes such a display of her big ships and her maritime skill in general, does not yet know ths surface of tbe ocean over which they sail; and twit the Englisb admirals for nsing their man-of-war for dredging for sea snails, instead of endeavoring to gain that information which even savage nations are possessed of." Mr. Hampden makes mention of a singular race of beings, whoss "heads are filled with putty instead of brains," and more than insinuates that those who differ from him belong to this race. May we bs permitted to ask if these putty-headed creatures were discovered after prolonged introspectiou by the "indisputable flat" who believes tbe world is not an oblate spheroid?

An Eastern newspaper has done a great scrvice for the by no means small class of nervous people who are ill at ease in a thunder-storm, and who have an exaggerated fear of being struck by lightning. The Hartford *Courant* has been gathering statistics which show that the whole number of deaths in this country during the year 1870, from all causes, was about 500,000. Of these, lightning caused 202. When the percentage is so small any one who considers it cannot well be uervous. The sun is really more dangerous thau lightning, for the number of deaths from sunstroke in 1870 was 397, yet few people are so excitable as to borrow trouble concerning sunstrokes. If the public could be thoroughly instructed in the laws of percentage, we should have fewer panics, and consequently lese mortality in time of epidemics.

Sir Charles Wheatstone has been elected Foreign Associate of the French Academy of Sciencee, to fill the vacancy occasioned by the death of Baron Liebig; and Mr. Gladstone has been elected a member of tbe Hungarian Academy of Science.

The Yellowstone Expedition.

Gen. Rosser, in chargs of the Railroad Survsy of tbe Stanley Yellowstono Expedition has submitted to the autboritiss of the Nortbern Pacific Railroad Compauy his official report of the resulte thus far accomplished hy ths sxpedition. He finds the new and final route across Western Dakota from Missouri to the Yellowstons River entirely practicablo and satisfactory, it being greatly superior to tboss of former days. The distauce, 205 miles, is twenty-one miles shorter thau the survey of 1871. The gradients are moderate, the average of work per milo is considerably less, ths number of important bridges is reduced nearly two-thirds, and the Little Missouri River, whiob former survsys crossed aeven and eleven times, is crossed once on the line so located. Tbe route runs immediately through only ono mile of tbe "bad" or clay lands, just east of tho Little Missouri. With few exceptions, ths country is a rolliug prairie, sometimes rising into low hills, ths grass being excellent and soil good. Good water was found tho entire distance. Coal outcrops at various points in veins several feet in thickness and timbor is more abundant than on former routes.

The report states that tbe main body of Gen. Stanley's expedition accompanied the scientifie corps, and most of the press correspondents did not accompany the engineers who were escorted by Gen. Custer's department, but followed tbe old abandoned route south of Heart river, hence descriptions of the region traversed hy the main command do not apply to the country traversed by tbe new route for tbe railroad. Ths directors of ths company have accspted the new line recommended by Gen. Rosser from Bismarck, the present snd of tho track, to the Yellowstone crossing, and bave called for proposals to grade and bridge this section of 205 miles.

Ths expedition is now prosecuting the survey westward up tbe left bauk of the Yellowstone to Pompey's Pillar, wbers it will join the survey made last year from ths west, and thus complete the surveyed line across ths continent. The entire command is expected to return to Fort Rice about October 1st.

The Transatlantic Cable and Planet No. 131.—An example of the free transmission of telegraphic dispatches relating to astronomical discoveries was presented on the occasion of the last new planst (No. 131,) discovered at Washiugton on May 26, and observed at Marseilles on May 27 of the present year. The news was received by Atlantic cable and telegraphed from Paris to Marseilles in the following cabalistic terms: "Planet, sixteen, fourteen, south, twenty-one, eighteen, movement, right, west, eleventh." This, being interpreted, means: "A planet has been discovered, of which the rigbt ascension is 16 h. 14 m., and the dcclination, soutberly, 21° 18′: its movement is directly toward the west, and it is of abont the eleventh magnitude."

It is an odd coineidence that the first planet discovered in America (during ths ysar, 854) was No. 31, so that this last new comer, No. 131, also first noted in this country, is the hundredth found since.—*Ex.*

The most plausible theory of comparativs calorific power is that long since enunciatedby Welter: that the heat eliminated depends upon the quantity of oxygen taken up, and that the amount developed by equal weights of oxygen, when made to unite chemically with other bodies, however different they may be, is always the same. In this opinion Welter has been supported by the researches of other chemists. Despretz, by uniting ons pound of oxygen with the following substances in turn, found that the water raised from 32° to 212° Fahrenheit was with hydrogen 29.5 pounds; with charcoal, 29 pounds; with alcohol, 28 pounds, and with ether, 28.5 pounds. But that the law is not univsrsal, is shown by the fact that the heat developed by the oxidation of iron is equivalent to raising 53 pounds of water to 212°, from 32° Fahrenheit. Thus the theory, while subetantiated by experiment up to a certaiu point, unaccountably falls short when it is attempted to press it further.

Electricity and Life.—Recent studies have done considerable to determine what the action of electricity really is in the excitation of muscular irritability in dead bodies. Tbe continuous current seems to act on muscular fiber after the manner of heat. If dead muscle be exposed to cold, the current restores contraction for a considerable period, but finally destroys it hy inducing persistent contraction. If, on the other hand, the dead muscle is left at its normal temperatnre, the current merely shortens the period of irritability by quickening contraction. Experiments lately made with the L eyden jar demonstratee that with sufficient current, small animals and birds can be made absolutely rigid for the moment in the position in which they stand; and so suddenly is the work done, so completely is the posture of life preserved, that nothing but actual examination with the hand can impress on the mind the fact that the creature has, with tbat sudden shock, passed from earth.

Some experiments have lately been made in in the arsenal at Vienna with a new explosive mixture, tbe "Volkman powder," which are stated to have produced very satisfactory results, and to have ehown that the new mixture is cheaper and more powerful than ordinary gunpowder.

The respective merits of asphalte and wood paving have been under discussion by the authorities of the city of London. When horses fall on asphalts their legs, it is urged, are "apread out," and tbey becoms injured for lifs. Falls on granits paving aro not, as a rule, attended with such serious rssults, nor do horsee fall on wood paving to ths same extent as tbey fall on asphalte. The question is still nuder discussion.

Mechanical Progress.

Ventilation of Mines.

As all improvements in this direction bear directly upon our on miuiug interests, wo taks from the *Rockdale Observer* (Englaud), tbo folfowing description of a new ventilatingapparatus invented by a Mr. Pilling:

Ths principle is to force air drawn from tho atmosphere by direct action, into the miue, and by means of pipes and otber suitable channels convoy it to any portion of aaid mins. To effect this purpose, the method to bs adopted is to use a number of cylinders attached to a horizontal steam engine, but differing from the latter in tbis respect—that the steam is not forced into the cylinder, but ths cranks whicb draw the pistons in ths air cylinders backwards and forwards are turned by a pulley, at ths end of the crank shaft, which is driven by steam. At each stroke ths piston, which is constructed on the same principls as the common pump, draws air into ths cylinder which is afterwards forced with great velocity through a pipe into a chamber, and thence through conduit pipes to any portion of the mine, or throughout its whole extent, so as to cause a constant current of pure air. The invention which is very simple, yet thoroughly effieient, will enable colliery propristors to dispense with the large furnaces, fans, etc., which are in use for drawing foul air out of mines; for witb Mr. Pilling's apparatus the air can bs convsyed to any particular spot in unlimited quantities. By those means the mins may be supplied with pure atmospheric air, which will diluts or displace ths foul air, and that without decrsasing ths atmospheric pressure, as is the case when the ordinary principle of exhaustion is adopted, which favors the emission of dangerous gases, while at tbe same time it will effect local ventilation. Any number of cylinders may be attached together in ordsr to produce a large pressure at one spot, or it may bs so arranged that a number of small pipes can be coupled to the air chambsr and carried to any distance with the pressure being decreased. The invention may be applied to any mine, or for a vast number of other purposes of ventilation. Mr. Pilling has made it to act on the opposite principle to that usually adopted in ventilating mines, which is by exhaustion, which necessitates a diminution of atmospheric pressure; and it therefore follows that by the present arrangement not only can the ordinary pressure be maintained, but it can be increased to any desired amount, thereby diluting any explosive gas or prsventing its issus at low pressurs.

The machine promises to bs an sxtremely valuable one. It is very simply constructed, scarcely liable to accident, and not expensive. We feel thoroughly convinced that the fearful risks to which colliers exposed by reason of accumulation of dangerous gases will be entirely obviated by the use of this machine, and the working of a coal mine, so far as these causes of accident are concerned, made as safe as any operations above ground.

A Genius, writing to the *Coal and Iron Record* says: "I venture ths prediction that before this century closes, locomotives will be driven exclnsively by magnetic power, and ships by the use of the power contained in the ocean itself, without the use of fuel in either case. Will you make a nots of this?" To which ths *Record* respouds as follows:

"We cheerfully make 'a nots' of it, but chiefly for the purpose of protesting against any claims which may be based upon euch crude ill-defined imaginings. Some men seem to think that the mere suggestion of a possibility confers on them a title to the uame of inventor. Our literature is filled with fulsome adulation of poets, who, in their vague descriptions, have attempted to mention something out of the common way, though they had no idea in regard to tbe methods or tbe results of which they wrote. How often has Tennyson's allusion to aerial fights been quoted as evidence of his far-seeing genius and power of invention? And yet the idea is not new, and the description as given by Tennyson has done nothing to clear the way for its accomplishment. So with the suggestions of our correspondent. Such prophecies have been made a thousand times in reference to tbese very things but thus far they have accomplished no good."

The Diamonn Drill.—The peculiar advantage of this drill in testing lodes, mines, or strata of rock formation is that it brings to the surface a continuous and unbroken core, shows the widtb and nature of the matter formed, through varying the driving of test shafts, and useless outlay of money in examining property. By eetting the drill at an angle a scientific calculation cau be made of thickness of lode or vein, and give the quantity of it by triangulation.

A Novel Transportation Scheme.—It is reported that Mr. Nehemiah Gibson, of Boston, is preparing a plan to shorten ths watsr transportation bstwesn ths coal markats and Boston. He proposss to constrnct iron barges for tha transportation of coal from Nsw York, Philadelpbia, or Baltimore, by way of Narraganasstt Bay and ths Taunton River, in Massachusetts. These vessels are to be vsry strong, eacb to hold four hundrsd tons of coal, and to be propelled by tug-boats. From some point on the Taunton River he thinks a railway can be constructed upon which these barges can be taken from the water and carried overland about twenty miles to the cars at Weymouth. In this way 150 miles of sea transportation will bs saved without breaking bulk. The construction of the road and barges, however, will bs very expensive. The rails, evon tbs author of the scbemo acknowledges, will have to be very large, made of steel, and laid on a road-bed much wider than the ordiuary railway. The plan has some interest as one of ths nsw points in the transportation question.

Syracuse, N. Y., has now a novel manufacturing onterprise, ons firm tbere constructing no less than seven mammoth windmills as large as the enemies of Don Quixots. Ths milla are designed for crushing gold ore, and are to bs sent to tbe Island of Ornba in ths Caribbean Sea. The prevalence of trade winds in that section, and the bigh prios of fuel, hava induced the quartz-crushing company to introduce windmills for ors-crushing purposss. An accurate idea of the size of these powsrful agents may hs conceived from tbs following dimensions:—Ths diameter of the wheel, which is of the "rosette" pattern, is 36 fest loug, thus securing power squal to a 20-horse power sngine. Ths weight of each mill is about 9,000 lbs., the cost of construction being about 1,600 dollara.

Asphalte Paper.—This articls is likely to become of great use in many ways. In thin sheets it is usefnl for wrapping silks or otbsr fabrics that need protection from moisture, for lining the cases, or packing boxes for pianos, etc., or rolled up into pipes for conveying water. Asphalte tubes are only one-fifth tbe wsight of iron, will not rust, and ars quits tough and strong. The tubss ars simply sheets of paper, of peculiar quality, dipped in melted asphalte, and then rolled upon a cylinder. A machins for preparing the asphalte wrapping paper consists of a hollow cylinder, heated by steam, and wedge shaped box, containing the hot asphalte. The box has a narrow slit, ths width of ths paper, and as the paper passes, a thin layer of asphalts is distributed on ths paper just bsfors it passes the cylinder.

Cork Jackets for Steam Boilers. — M. Ohevallier, a French enginser, has adopted cork for the jacketing of boilers and other parts of machinery. Cork is known to bs an excellent non-conductor of hsat, and thess cork jackets are said to diminish the outward radiation by 15°C. The cork is cut in ths form of staves, and thess are united together by tongues, as in the case of flooring boards, so that the lines of junction are protected, while the cork staves ars easily rsmoved, when ths necessity occurs. Portions of ons of thess jackets, which had been on a boiler at work for fifteen months, were sxhibited ths otbsr day at a meeting of tbe Paris Society for the Encouragement of the Arts, etc., and were not found to have been in any way affeoted by ths hsat of the boiler.

Materials from which Paper is Made.—Ths materials of which paper is manufactured ars vegetable aubstances containing fiber, and ars not so limited in nnmber or kinds as is commonly supposed. Linsn and cotton rags, old paper, ropes, cotton waste, sweepings of flax mills, jute, surat, straw, linden and other woods, hemp and many otbsr substances, offer a long catalogue of materials from which to choose that most suitabls for making the particular description of paper wanted. Almost svery day new names are added to the list; from ths most unpromisiug and apparently worthless substances, it is found that some kind of paper can be made, provided ths original material bs fibrous.

A Bridge Across the Bosphorus.—Signor Antonio Zimello, of Vicenza, the Italian engineer who some time since announced his project for a route by way of Trieste and Belgrade, or Brindisi and Valona, to Constantiuople, and thence by the Euphrates Valley Railway to Bombay, has now devised a scheme for bridging the Bosphorus. He believes a bridge may be erected, resting on eighteen pillars, at a hight sufficient to allow vessels to sail under it. These pillars, being firmly united together, both by the bridge and by connecting stays 15 meters below the surface of the sea, will render the whole bridge, so to speak, a complete mass, the central pillars of which will be sustained by pontoons under the water.—*Iron.*

The largest casting ever made in Harrisburg was turned out lately at tbe foundry of the Harrisburg Car Company. The casting is 30 feet long, 2 inches thick and 8 feet wide, weighs about 14 tons, and is intended as a bed-plate for the engine being constructed at the machine works for the new water works.

The largest pumping apparatus in the world is that recently completed in England for draining tbe Ferrara marshes. The total capacity is 456,000 gallons discharged per minute, at a mean lift of 7 feet 3 inches.

Weekly Variations in Stocks.

A NEW quicksilver mine has been found near the east end of the "Hog's Back," on the road from Healdsburgh to the Geysers, Sonoma county.

THE Brown Bear Ledge, according to the Yreka *Union* has just turned out 210 ounces of gold from 80 tons of rock.

THE Raymond & Ely mine has more lega trouble on its hands, a restraining order against it having been issued from the United States District Court of Nevada. The ground in dispute is claimed by the Kentucky Mining Co. It is the same as that claimed by the Hermes, Pioche and Raymond & Ely.

Our Weekly Stock Review.

SAN FRANCISCO, September 4, 1873.

At last we are able to chronicle an improvement in the mining stock market, which has occurred during the latter part of this week. Stocks had fallen about as low as it was possible for them to do and everybody expected a rise after election, but it began a day or two before and still continues. The rise is not very great, but in view of the late general depression which has lasted so long, it is quite encouraging. We may congratulate ourselves on the fact, however, that during all this stock depression legitimate mining has been prosecuted with even more vigor than usual, and the bullion production of the mines of the Coast is steadily increasing. Wherever good, first-class mines are found, the owners would rather hold on to them themselves than trust the property in the doubtful and variable form of stock, which is liable to fluctuate disastrously through extraneous circumstances. In fact legitimate mining enterprises are far more plentiful than they have heretofore been, for people no longer buy "paper mines." There must be some foundation or no money can be raised.

The Raymond & Ely Company are in more trouble, an injunction having been served upon them, to stop work on the ground formerly claimed by the Hermes, the title to which is claimed by the Kentucky.

The dividend declared by the Eureka (Gr

blankets and grub, sailed out for Waucoha last Thursday, on a general prospect. The Waucoha company have a few men at work driving tunnels, etc., but it is rumored that they will undertake some important operations before long.

AMADOR.

The Oneida Mine.—Sutter Creek *Independent*, August 23: We are pleased to learn that the work on this mine is prospering finely. The rock from the lower levels never looked better, and the hanging and foot walls are as firm and well defined as any in the county. The mill is running with a full force and crushes out its regular monthly allowance of the precious metal. Under the able superintendence of Wm. M. Stewart, Esq., the Oneida has been made a paying institution, and its owners will soon be rewarded for their long waiting. The machinery and works are all in excellent order.

CALAVERAS.

Happy Valley Fluming Claim.—Calaveras *Chronicle*, August 23: We learn that work is steadily progressing in the old Happy Valley Fluming claim with very flattering results. Mr. Drumm, proprietor of the mine, is preparing to make extensive improvements, contemplating the laying down of an entirely new flume. He is just reaching the deep deposits of gravel in the flat that composes the claim, and there is every indication that the yield of the mine in the future will be even greater than in the past. Happy Valley isn't played out yet.

Rich Rock.—We are glad to learn that rich rock has been struck in the 200-foot levels of the Good Hope mine at Mosquito Gulch. Quartz is now being taken out in quantities sufficient to keep the mill—an 8-stamp battery—in constant operation. We expect to be able to chronicle very favorable results from the crushing in a few days.

San Bruno.—We learn that rock has been struck in the tunnel that is being run in the San Bruno mine at Mosquito. The tunnel is about 400 ft. in length, and is nearly all the way in bedrock. The ledge, where uncovered, is about 2 ft. thick and shows very well. The proprietors of the San Bruno deserve a rich reward for their energy and perseverance, and indications are that they will meet it.

Blue Mountain Mines.—The furnace for roasting sulphurets, at the Heckendorn mine, is completed. This is of great importance in the working of the mine, and is a perfect success, for being so worked the sulphurets pay from $150 to $200 per ton. A second and lower turbine water-wheel has been added to the motive power of the mill, so, with the same supply of water, a much larger quantity of quartz will be crushed daily. The Imperatrice Eugenie, Prince Imperial and Good Hunter, also prove to be very rich; good quartz and wide veins. A wagon road from Sandy Gulch to Blue Mountain will be opened very soon.

The Stickle.—Sutter Creek *Independent*, Aug. 23: The Stickle at Angels closed out one day last week. Several men were in consequence thrown out of work, and will have to seek employment elsewhere.

The "Big Mine," of the same place, still continues work, though fears are entertained that it may be stopped soon unless better rock is found.

The Wallace & Ferguson, at Sheep Ranch, holds out as good as ever. The rock now being crushed yields from $40 to $50 per ton; and the cost of taking it out, hauling and crushing will not exceed $10 to the ton. The rock which is now taken out comes from the drifts near the surface. Deeper down it pays as high as $200, and from that to $500. Of course the extra rich rock comes out in smaller quantities and is attended with greater expense.

HUMBOLDT.

Columbia District.—Yreka *Union*, Aug. 23: A Coyote shaft on the Badger has followed the vein to a depth of some twenty feet, yielding a constant quality of ore that will produce over $100 a ton.

The Rosedale and Extension were down about 10 feet, the ore being of the same character as the Badger, except that it contains more silver.

The Goose Lake claim has exhibited two or three pockets surpassing anything I have ever seen in the mines—the rock literally hanging together by the net work of gold running through it after being shivered under the hammer. The Gaddy, Shoo Fly, and several other claims lately discovered prospect about the same as those named, but their state of development could give no satisfaction as to their extent. In a few words the prospect was never better for a fine and prosperous camp.

NEVADA COUNTY.

Starten Up.—Grass Valley *Union*, August 26: Yesterday the steam machinery for driving the pumping and hoisting works at the Magenta mine was started up. Everything worked well and harmoniously. The Magenta is north of the Empire and is on the Ophir Hill and Rich Hill ledges. Sinking and systematic development will be pushed rapidly forward, and we have no doubt but a fine mine will be opened. Mr. George C. King is the Superintendent.

SANTA CLARA COUNTY.

McLeod Mining District.—Gilroy *Advocate*, August 30: We are pleased to learn that the news from the McLeod Mining District is cheering. The Stayton Bros., after a long siege of patient toil, having struck immense deposits of quicksilver in their claims. Indeed we hear on good authority that there are tons of the richest quality of ore in view. They have, through their energy and perseverance, developed a district rich in mineral wealth, that will add much to the prosperity of Gilroy.

TRINITY.

Minersville.—Trinity *Journal*, Aug. 30: We passed through this place on Tuesday last. From the quietude which prevailed a stranger might have thought it the center of one of those dead and alive places in the mines that we read of. Such is not the case, however, the miners being all busy at work preparing for the approaching winter, which they are in hopes will be a wet one. There has been quite an accession to the population of this camp since the election last Fall, as the vote next week will doubtless show. Both Stewart's Fork and East Fork are lower this Summer than ever before known, and mining along the latter stream is pretty much at a stand-still, there being but one company at work there.

TUOLUMNE.

Kincaid Flat Tunnel.—Union *Democrat*, Aug. 30: During the season the company owning this claim have been engaged in opening it up; a large hole in the flat has been washed out by hydraulic means. Vast amount of boulders have been encountered, leaving small quantity of earth for washing. What ground was washed paid very well. The tunnel is being extended 250 ft. further into the flat, which will bring it to the deep ground that is believed to be rich. The tunnel is now being run at the rate of 7 feet every 24 hours.

Tuolumne Hydraulic Mining Claim.—In this claim, formerly known as the Rough and Ready, situated in Table Mountain, we learn a fine lead of gravel has been developed that pays handsomely. This new find is way in the mountain, beyond where the old company worked, and where the new one commenced.

The Table Mountain Blue Gravel M. Co.—Union *Democrat*, Aug. 23: We learn that the results in this mine are proving highly satisfactory, being enabled to declare dividends right along. This company have recently purchased the adjoining Alpha claim and are making preparations for extensive operations. The old works are being pushed, and a contract for another incline was made last week and work was commenced this week. In a few days this company will have 150 men at work.

Tuolumne *Independent*, August 23: Patterson Mine.—Yields some very rich specimens of gold quartz, not found yet in great abundance, but with such richness as to give most encouraging promise.

Gross Mine.—On same lead as Pattereon, yields by arastra from $60 to $120 per ton, and has ore enough in sight to pay the cost of a quartz mill.

Raw Hide Mine.—Is just beginning work in earnest to reduce the water first and then the rock. Two buckets in this mine will discharge 10,000 gallons per hour and the pump 15,000 ditto.

On the Ford Claim.—At Saw Mill Flat, Whiting, Gorham and Wilson have struck another rich pocket in their lode. They do not talk much about it, but report says they got about $3,000 last week.

Table Mountain.—Gravel mines hold out better encouragement than ever. The men who have long waited for something to turn up in that hitherto quiet region west of Table Mountain seem about to realize their wish.

Nevada.

WASHOE.

Crown Point.—Gold Hill *News* Aug. 30: Sufficient ore is being extracted to keep all the mills going. The Rhode Island, Atlas and Pioneer mills in Gold Cañon are being run to their full capacity, as is also the Morgan mill, on the Carson river; the Brunswick and Mexican are crushing 50 tons of ore per day each; the usual amount of ore is still being extracted from the 1,000, 1,200 and 1,300 ft. levels. The ore breasts are looking as well as usual. The work of sinking the north and middle winzes from the 1,300 ft. level is being pushed forward as fast as the water recedes; the pumps are kept busy all the while; all of the winzes are in high grade ore; the south drift, on the 1,400 ft. level, is being driven rapidly forward toward the Belcher line. The drift, from the 1,500 ft. station, is being pushed ahead vigorously.

Consolidated Virginia.—At this mine the greatest activity prevails in all the departments. A strong force of carpenters are employed in the construction of machine, blacksmith and carpenter shops, and a heavy stone wall is in process of erection in front of the works on F street, for the foundation of the ore house. The excavations for the several tank-pits in the main shaft are completed, and the tanks are being constructed therein. The pumps are nearly all in readiness for lowering to their respective stations in the shaft. Better progress is now being made in the drift from the Gould & Curry mine (1600-ft. level). The flow of water therefrom has greatly decreased, and it has been advanced 3 ft. per day during the past week.

Ophir.—The sump to the main shaft, 20 ft. deep below the 1700-ft. level, is completed, and the station for the drift in the ledge is being opened. The vein matter is chiefly barren quartz and clay. There is a body of quartz found at this point 2 ft. wide at the north side of the shaft and 6 ft. on the south. It assays mere traces, but the drift may possibly follow it south into a body of ore. The south drift at the 1300-ft. level is being driven ahead in favorable looking quartz, mixed with clay and porphyry. The quartz gives low assays.

New York Consolidated.—Shaft 335 ft. Water increases considerably at the bottom of the shaft, but is kept out by the bailing and pumping arrangements, and very good progress under the circumstances is made in sinking. The indications at the bottom of the shaft are of the most favorable character, unusually so, for striking a good ledge.

Gould & Curry.—Daily yield 45 tons of ore, taken from the second and fourth levels. On the 1500-ft. level two cross-cuts are being made in the vein, and ore of a low grade has been met with within the last few days. On the 1600-ft. level the east cross-cut presents but little change. The quartz continues in the drift is carried forward. The east wall has not yet been reached. Considerable water has been flowing from the face of the opening during the past three days, which indicates its close proximity to the eastern ore vein.

Dayton.—The main drift running west from the first station, at the 225-ft. level, has passed through 30 ft. of ledge, showing 18 ft. of fine ore. The work of extracting the pay-ore progresses. On the 1st of next month will commence driving northward on the vein a distance of 150 ft. to a point underneath a winze, which is being sunk from the level above, where a large ore body was developed last year.

Hale & Norcross.—Daily yield, 45 tons of ore, which is reduced at the Trench mill, in Silver City. The ore-breasts throughout the upper levels of the mine present but little change since our last weekly report. On the lower level they are running many exploring drifts, in some of which the indications are very flattering. They are now occupied in excavating a tank and pump bob-pit in the main incline, preparatory to sinking for the 1,000-ft. level.

Belcher.—Daily yield 400 tons from the ore sections of the four lowest levels, all of which continue looking and yielding well as usual. The main incline is down 67 feet below the 1300-ft. station. The rock at the bottom is hard, but works well. The drift from the incline to meet the drift south from the ore-stopes of the 1300-ft. level is in 33 ft., and being driven ahead as fast as possible. The south drift aforesaid is in 327 ft. from the Crown Point line, with the face still in good pay-ore; and the cross-cut east is in 45 ft., all the way in excellent ore. The winze, below the 1300-ft. level, is down 55 ft., and that below the 1200-ft. level is down 23 ft., both in fine ore.

Silver Hill.—Extracting the usual amount of ore, which is taken from the body south of the shaft, and from the ore deposit north of the same. During the week, farther north and 50 ft. from the Justice line, some very good ore has been found, which bids fair to be a substantial and permanent body. The work of prospecting in the second station and driving the main drift north is being pushed forward vigorously. The general appearance of the mine is good.

Imperial.—No particular change to note in the appearance of the mine since last report, and no new ore developments. A seam of clay is cut through in the east drift at the 1,700-ft. level, but the rock beyond it appears about the same as that already passed through—no ore in it. Some little water is encountered, but no sign of east wall. The south drift at that level is still in quartz, and of a more favorable character than heretofore. The main incline is 140 feet below the 1,700-ft. level, making six or seven feet per week.

Sutro Tunnel.—Total length 4,310 ft. Besides working in the face of the main tunnel, work is resumed in shaft No. 1, which is down to the tunnel level, drifting both east and west on the line of the tunnel. Over 100 ft. of tunnel has thus been made through this shaft during the past week or so. Operations are about being resumed at the other 3 shafts along the line.

Mint.—Still drifting ahead along the ledge at the second level, with very encouraging indications. Another level below would more effectually and satisfactorily test this mine, and the company will doubtless soon decide to sink their main shaft deeper for this purpose. The ledge, so far as explored, shows finely, the rock being of excellent and most promising character.

Julia.—Driving the east drift on the 800-ft. level; face of drift in solid quartz. Character of rock black, dirty looking, and carrying very little metal. Lowering the water in the shaft steadily. About 60 ft. of water remaining above the 1000-ft. level. Have just placed in position a new engine, together with a No. 4 Root-blower which started up yesterday.

Knickerbocker.—Main west drift in 756 ft., the face showing quartz and other vein-matter of a very encouraging character. The cross-cut of the southwest is in 167 ft., with the face in hard rock, which works well, however, and looks fine. The general progress of work in this mine is very satisfactory.

Empire.—At the 1700-ft. level the east cross-cut has passed through a clay seam, but the rock beyond is softer, allowing of better progress. This drift will be run east till sure of being beyond the east wall. A drift is being run north from the winze, a short distance below the 1600-ft. level, in a place which promises good ore-development.

Chollar-Potosi.—Daily yield 145 tons, giving average assays from car samples of $34 per ton. The old ore sections continue looking well, and the ore from the east drift recently run from the west Blue Wing section yields the same as last week—about $10 per ton.

Occidental.—In this mine the work of extending the lower tunnel is continued, with flattering prospects as to the quality and extent of the ore-vein. The ore-breasts in the upper and lower tunnels are looking well. The mill is constantly employed in reducing the ore.

Caledonia.—Extracting about 60 tons of ore per day, taken from the 400 and 500 ft. levels. Furnishing the Sapphire mill, and ore accumulating. The new development on the 500-foot level show material improvement both in the quantity and the quality of ore.

Baltimore Consolidated.—We have no particular news of importance to record relative to this mine, this week. Work is going ahead at the upper and lower levels as usual. Water troubles considerably, especially at the lower level, but it is draining out fast.

Tyler.—The ground at the lower part of the shaft has been very bad, and difficult to manage from its disposition to cave, but it is at last well secured, and good headway is being made in sinking. The pumps and everything work well.

Buckeye.—The ore breasts all look and prospect better than they have for some time past, consequently better milling returns are realized. The average assay of car samples is about $17 per ton.

Woonville.—A new plan of operation has been determined upon with reference to this mine. The Superintendent has received orders to discontinue the sinking of the old incline and to sink a three-compartment perpendicular shaft which will be located some 400 or 500 ft. north, and 300 ft. east of the old incline. In the mean time they will take out all the ore that can be found in the old mine, the present daily yield of which is sufficient to supply a ten-stamp mill.

Justice.—The cross-cut east at the 400-ft. level is progressing well, and is expected to encounter good ore very shortly. The prospecting drifts of the south mine are showing well, considerable good ore is being taken from the Waller Defeat section.

American Flat.—The main drift from the Baltimore 450-ft. level is progressing ahead at a lively rate, and the indications are very promising, even more so than in the Baltimore at that point.

Savage.—Cross-cutting at the 1600 and 1700-ft. levels develope nothing new as yet. Good work is done there, and also in sinking the incline, the rock working well.

Succor.—Sinking the small shaft in the ravine is stopped on account of water, and a drift is now being run for the ledge, which is near at hand. Good pay ore is expected.

Utah.—The pump engine and pump will be ready for work within a very few days. The sinking of the main shaft will then be resumed.

WHITE PINE DISTRICT.

Eagar Mine.—Work in the 150-ft. level is being pushed ahead with all speed, and reveals immense quantities of ore with a splendid prospect of continuance. The main drift from the Eagar shaft is now being followed in good ore toward and under the workings of the Hidden Treasure, and, as progress is made, the vein shows a decided pitch downward. We were allowed to see the result of several blasts at the time of our visit, it being nearly six o'clock, and the shifts in the act of relieving each other, which gave us a better idea of the immense amount of pay ore being taken out at this time. The usual average of 30 tons per day is being shipped from the mine, and the amount could easily be doubled without much extra exertion.

Eberhardt & Aurora. — The mines of the Eberhardt & Aurora Company are still looking well, and continue to produce the usual amount of fine ore. The Peerless Chamber particularly, shows no signs of diminution, but, on the contrary, gives rise to great hopes of its permanency as an ore-producing locality. The contract for crushing ore for the company, entered into with the Stanford mill, is nearly completed, and, by the 1st of next month, prospecting will be vigorously pushed ahead on other portions of the mines to enable the company to open ore bodies sufficient to supply the new mill, now in course of erection, during the Winter months.

Effect on Eberhardt.—Our neighboring camp at Eberhardt begins to assume a more lively appearance than has been the case there for many months, consequent on the work being done by the English company. Buildings long unoccupied are being refitted, and parties are busy getting things in shape for the increasing trade.

Arizona and Utah.—Sinking the incline east from the shaft rapidly, encountering low grade ore all along. Sinking main shaft as usual.

Sierra Nevada. — Extracting and milling sixty tons per day. The ore taken from surface workings is improving in quality.

Pictou.—About 40 feet have been added to the length of the tunnel since last report. Ground working well.

Crown Point Ravine. — The developments in the 250-ft. level continue looking well. Some very good assays are given.

Yellow Jacket. — Nothing new to report. Still drifting in the ledge at the 1400 and 1500-ft. levels.

The Buchanan Tunnel.—This tunnel, in Table Mountain, on Fonda's ranch, west of Columbia, has recently been re-opened by James W. Mandeville & Co., with Mr. M. as Superintendent. This claim was suspended some years ago on account of water, the tunnel not being deep enough to drain the ground. As soon as the present Co. get in to the gravel, they will put on machinery to cure the water evil, and will be well rewarded, as the claim is reported valuable.

San Francisco Manufactures. — What they Are and Might be.

In s city like San Francisco, not more thsn twenty-five years old, and the capital of a land chiefly famed for its metallic treasures of gold and silver, it would not be expected that any great manufacturing prominence should be attained, inasmuch as the length of time elapsing would be too short to permit of the gathering together of a sufficiently large population, and even then the minds of the people might naturally be expected to be fixed on other and more enticing pursuits. Nevertheless the status attained is fully commensurate with her population, though not with the population of the coast, of which she may be regarded as the capitsl. Excluding the value of the gold and silver refined, that of the other manufactures of which San Francisco is the seat cannot be less than $45,000,000, although the census returns would not make them so much, but considering that for various reasons not necessary to mention, the enumerators would not have been given the true returns, their growth for the last three years would be amply sufficient to make up the difference, so that we may make it that at least. Besides in the course of a very exhaustive review made by the *Bulletin*, a couple of years since, it was set down at just that figure.

The Principal Articles Manufactured

Are those of which Iron, Lumber, Leather, Tobacco, Wool, and the various food-producing articles are the besis. One entire section of our city is occupied preponderatingly by foundries, both in iron and brass, by boiler shops and machine shops. The demands of the great mines of the coast, impossible to be satisfied elsewhere, have called into existence the scores of busy workshops that exist in this section, and have given employment to their hundreds of workmen. Then the preparation of the prodnct of our various mills, of our furniture factories, and of our coach aud carriage factories need the services of several thousand busy and contented *proletaires*. The leather of this State, tanned as it is with oak bark, is much superior to the ordinary Eastern leather, and there is a demand in New York, Boston, Philadelphia, and other manufacturing centres for all that we can produce and much more too. Great portions of this State are fit only for pastoral purposes —at least one-half of it is of this character, and the flocks and herds of to-day would not be missed ont of those of twenty years to come, while our own demand and thst of those centres spoken of will be enormonsly increased. The leather now made up in San Francisco workshops is of all sorts, principally, however, the more common and utilitarian article of sole leather. But kip, kide, etc., are also made, and by men whose enterprise and faith in the building up of a trade in the locally manufactured articles which should drive away that in the imported, has through years of discouragement never for a moment flagged. Great progress has also been made in the art preparing faucy colored leathers from sheep and goat skin, and a large quantity is already supplied to our boot and shoe manufacturers and book binders. Boot and shoe manufacturing has during the last four or five years taken great strides, and now the Crispins of our city are fully as important members of the social and political body politic as they are in the New York, Philadelphia and Massachusetts.

Shoe Manufacturing Centres of the East.

It might be thonght that the cheap labor, better machinery, and larger establishments of the East would fsvor its commercial men and by making them able to produce so much more cheaply than we can, render impossible competition, on the part of local manufacturers. But our people do not run on cheap foot gear as a rule, and never have done so; they want good understandings, and the importations have not been as remarkable for durability as for cheapness. This afforded some enterprising men amongst us the opportunity sought, and the superior articles made by them has for years held its own against all competition. Still the trade in Eastern ware has continued large, forming fifty per cent of the whole, but that is also being undermined by the employment of Chinese labor which produces cheap shoes which do not bear unfavorable comparison with those of the East. As to the propriety of exposing Eastern white workmen to this kind of competition we express no opinion, and refer to it merely as a commercial fact. The reasons given sufficiently account for the prosperity of the numerous establishments with their thousands of workmen. In a country where

Nature has Scattered her Riches

With so lavish a hand, and whcre the general prosperity and riches are consequently so far in advance of that elsewhere wituessed, the character of the community as a luxurious one might be expected to rank high, and amongst other directions to make itself felt in the direction of more than ordinary gorgeous turn outs. And so it is—the proportion of the people who avail themselves of walking as a means of imparting health and vigor to their bnsiness enervated frames, is probably smaller than in any other American continent, and the extensive employment of horse flesh has given rise to an equally extensive demand for all tbe gear accompanying it. Hence the saddlery and harness business is one of the most flourishing in the Golden City. Manufacturing is prosperous too, although the import trade is immense, and npwards of fifty establishments sttest the growing importance of the local trade.

Our Woolen Mills.

Thongh even now large and pretentious institutions may be regarded as only in their infancy. We have all the facilities that could be wished, for the manufacture of woolen goods. And the raw material we have in such abundanco, that we are not excelled in that particular by any city on the American continent. There are the foothills which can raise an illimitable number of sheep, producing the best wool in the world, and then we have the great continent of Australia from which we can draw equally illimitable supplies—sufficient to prodnce all the woolen goods required for the supply of the markets of the earth. Almost with the establishtion of our State did the Pioneers of this business start in this city. Followed up by Donald McLennan, the Mission Woolen Mills were established, which absorbed the Pacific, and which is becoming not only one of the largest establishments on the Pacific Coast, but throughout the Union. The cloths made at our local woolen mills, and also we may say, at the Pacific Coast ones in general, are, though wanting in the variety which they will exhibit when a larger market justifies the additional expense, said by those who claim to be connoisaurs, to be equal to any and superior to many of those manufactured at the most celebrated mills of the East. And the blankets, shirts, etc., are certainly of quality with which anything imported might in vain hope to compete. Over one million and a half dollars worth of woolen goods are turned out annually by these two mills. San Francisco must always be the great centre of this manufacture, for though many places throughout the State are, from position, water power, etc., peculiarly suited to it, yet as everything required in it, save the raw material, must be lookcd for in this city and transported thence to the interior, and as the bulk of the manufacture would have to be brought hither as its distributing point, and as capital will always tend towards the great centres of population, it is evident that competition with Golden City mills will become a very difficult if not impossible task. In the matter of textile fabrics outside of weoleu goods, we have made very small progress. Thus though the mulberry thrives here as in sunny Italy, and though the cocoons produced are of the first quality and productivness in the world, yet all we have as yet to show in the city or State is a silk thread factory, a ribbon factory, and a silk factory just beginning to struggle for existence. The silk thread factory has not been half as prosperous as the enterprise of its promoters deserved, at one time it gave employment to fifty hands, but the nnmber should be doubled. Both the ribbon mill and the silk factory known as the Franco-Itslian silk factory are new enterprises, and have a great deal of uphill work to perform before they can hope to begin to displace the fabrics of England and France. But their promoters are men of push and enterprise and we have no doubt will finally overcome all the difficultcs that lie now in their somewhat thorny path. In the manufacture of substances used as articlcs of food and in that of

Malt and Spiritous Liquors,

It is our opinion that we do not rank the last of the cities of the Union, and probably shall not, as the Temperance excitement which has taken hold on the people of many of the Eastern States, will have the effect of shutting up many of the giant establishments there existent, may perhaps, of driving hither some of the thirsty souls whose longings cannot be appcased by the ginger-beer and sparkling water of the Atlantic States. But without any such adventitious aid we can make a respectable showing, and one quito creditable to the bibulous tendencies of our people. Just for a moment try and imagine what becomes of the odd one hundred and fifty thousand barrels of lager, of ale, and of porter which are here made by the sons of the land of the Rhine, assisted by those of a few other nations. One of the largest manufacturing establishments that we have in the city is one for the making of lager, where nearly thirty thousand barrels are made yearly. And the San Francisco Stock Brewery pays its dividends with a regularity unexcelled even by Belcher and Crown Point, and promises to do so at least as long as they. The ale and porter made at another manufacturing establishment is claimed to be equal to any that ever saw the light behind the white cliffs of chalky Albion, or the emerald sea slopes of green Erin.

The Beer, Ale and Porter manufacturers numbering close on forty, cast all other similar institutions into the shade. There are only four distilleries, but these make up in quality for what they want in number, producing on an average half a million of gallons annually. Just imagine what a fiery throat the sovereign people must have to swallow all this, in addition to the stock of fire waters imported from abroad, and marvel not if the over zealous should hint that it was the tunnel that led to shades Tartarean. The distilleries which all cost a great deal of money, are most of them substantially built, and are furnished with elaborate machinery, worth thousands on thousands of dollars. The manufacture of California Champagne occupies three establishments, including the well known house of Landsberger & Co., and Eberhardt & Lachmund. These gentlemen aim to monopolize the home market, and to supply at least *real* Champagne, and they also are determined to make New York and its sister Eastern States bow the knee to Oalifornia in the matter of Champagnes and other wines hitherto looked for almost entirely to France and Spain. But it ie not only to the East thst they may look for laurels. Shipments have been sent to England, who may cre long in order to gratify the tastes of her subjects for California Champagnes deem it expedient to conclude a commercial treaty in their regard with the United States, similar to that which she concluded with France. We need say little more about the minor manufactures included under the heading of liquors, further than to say that we prepare malt, make soda, and refine spirite, and that under the experienced manipulation of those whom it may concern, Alcohol becomes quickly changed to Gin, Brandy, Whiskey or Rum, at the good will and pleasure of tbe operator. The aggregate value of the manufacture of articles of

Domestic Economy

Is by far the largest of any (not less than twelve or thirteen millions of dollars worth per annum) clsss of goods being made in our city. The production of Flour by the mills of the city both for local trade and for export is always large, never being less than three hundred thousand barrels and not unfrequently more. Of this, much finds its way to China, Australia and Manilla—even to London. One of the largest and most important industries that we have hitherto carried on has been that of Fruit and Meat Canning and Preserving, and it is likely to be of still more importance in the not distant future. A very few years since, this industry was started by poor men, with all tbe reputation of first-class Eastern goods to contend against. They had no particular help, nothing but their own indomitable will and strength of purpose carried them along and enabled them to steer clear of all the shoals and breakers that surrounded their course. This much may be said of this business, that its value aggregates now at least two million dollars per annum, and that it has furnished to the farmer and fruit grower a means for disposing of all the fruit they may raise for California, preserved fruit is in demand all over the world. The business consumes over one million pounds of the finest sugar, over three million pounds of fruit, and one hundred thousand pounds of meat. And though Salmon is not packed in this city, it is sold by all our packers, and is exported to all countries, England, Australia, and other lands taking away large quantities by every ship aud every steamer.

Pork and Beef-Packing

Used to rank high in the industrial scale, and in addition to other things we used to make besides other products, over one million pounds of Ham and Bacon yearly. But that is so uo longer. The railroad has helped along the Eastern mannfacturers so that they have almost ruu our present establishments out. All the islands of the Pacific almost pay tribute to us in the shape of Coffee unground. Central America comes first, and promises to be one of the best, if not the best of our sources of supply. Manilla comes next, etc. Nearly three million pounds are ground in this city. This with the grinding of Spice gives eight or nine establishments support by this very necessary process. Besides the Coffee, these establishments put up every twelve months about a million and a quarter pounds of Spice.

In things of comparatively little moment or those which would naturally be deemed as such, inasmuch as their place in the economy of home is small we have quite a large and flourishing manufacturing trade. We have two manufacturers of Mustard, but Burr & Co., take the lead. Their factory at North Beach is one of the most complete establishments in the city, and contains improvements in machinery unknown elsewhere. The product of both factories is fast taking the place of the foreign article. The seed used formerly to be obtained from the wild Mustard plant which grows extensively all over the State, but of late farmers have paid attention to its cultivation, and the most of it used now has been cultivated. Not less than half a million pounds are annually manufactured. The Biscuit and Ship Bread manufactured is worth half a million dollars yearly, the weigbt in pounds being nearly ten million. It is of a superior quality and is made almost exclusively by one company, which has swallowed up three or four others that formerly had an existence in this city.

Yeast Powders, Cream Tartar, etc., occupy one large establishment and three or four small ones. A quarter of a million gallons of Wine are yearly converted into vinegar. The production of Maccaroni, Chocolate, etc., occupies four factories. The former, made by Italians, vies in quality and variety with that produced on the shores of the Mediterancan. The Chocolate is made by one firm only, that of Ghirardelli & Co., also Italians.

Cigars

Are *par excellence* the manufactnre of San Francisco, not less than three thousand men being employed in their manufacture, and the establishments where they are produced numbering over one hundred. Tho annual value of the manufactured article is over five million dollars, and the cigars made are of the immense number of one hundred and fifty millions. This business is the stronghold of the heathen Chinee, and at least one half of the number of those engaged in industrial pursuits in San Francisco, are engaged in putting up in this form the fragrant weed, the prodnce of Connecticut and Havana. San Francisco cigars are known in every portion of the Union. A few white men are engsged in the business, and there is a Spanish Cigar Maker's Association, the members of whom are Mexicans, and who are not regarded in the most favorable light by those who employ Chincso. Some of the establishments are immense, the nnmber of hands employed reaching far away up into the hundreds.

The Manufacture of Chemicals

Has long been struggling ahead in our city, and was far more prosperous two or three years ago than it is at present. Acids have been the principal product, there being at one time three establishments devoted to that object. A step in advance has been lately made by the Pacific Chemical Company, who have established works at North Beach, under the superintendence of Mr. Henry G. Hanks, a practical chemist. The company propose increasing their facilities as necessity demands, and are now running on a firm basis. Manufactures of Sulphates, etc., are extensively carried on at Hunter's Point, and at an establishment on the San Bruno road, and two or three have snccessfully carried on the preparations of tho various forms in which Soda is used in commerce, the refining of which, large quantities are now sent by almost every steamer to the East, and also to England has for a couple of years lsst formed quite an item of our industrial interests.

In so Wealthy a Community

It was to be expected that the furniture and appointments of our private houses wonld be most superb, and that our millionsires would not be over particular as to the price paid by them for good articles, and this has been the case, the result being the establishment of a great furniture and upholstery manufacturing interest. The quality of some of the warc is most superb, and the workmanship hardly to be excelled while in the latter the richest tissues issuing from the looms of France, England and Germany are used with a lavish prodigality characteristic of the land of gold. It is quite common for orders for furniture, etc., of a single chamber, worth thousands of dollars to be received. And the arrangements for turning the more common and useful articles have reached a high degree of perfection, the story of the wool going in at one door of the factory and coming out at the other in the form of ready-made clothing, being well illustrated in at least one of our furniture factories. The finest palace car ever constructed in America was made at the factory of the Kimball company on Fourth street. The most beautiful and gorgeous woods with hues born of the tropics, and yielding when polished the most brilliant colors were used in it, and whether the material or the workmanship was considered, it was indeed unrivalled. Sent East it perished in the great fire of Chicago. The factory to which we have made reference, in connection with, is one of the representative ones of the State. Carriage, railroad car-building, etc., being carried on in it, and each department being a complete establishment iu itself. There are at least fifty smaller ones scattered over the city, the most noticeable of which is that of Pollard & Carvill, whose carriage work is unrivalled. Receiving in this city every year over

Two Hundred Million Feet of Lumber.

It might be expected that our manufactures in it would be numerous and varied. And so they are. In addition to those already noticed, manufactures of doors, sashes, packing boxes, picture frames, kegs and barrels, billiard tables, matches, trunks, woodenware, cigar boxes, stairs, windmills, lasts, pumps, bellows, pianos, boats, jewelry boxes, show cases, baby and toy carriages, turned and carved work, ship blocks, canes, billiard furniture, and brushes are made. The door and sash manufacture occupies nine mills, whose products are not only used on the Pacific coast, but are exported to Australia, China and Japan. In one or two factories the work is performed almost entirely by machinery. Chinese labor has begun to invade this department too. The manufacture of Woodenware is carried on by two large city establishments, and with the development of the pastoral resources of the State is becoming daily of more importance. Its annual value is not much under a quarter of a million dollars. The demands of wine casks, etc., have for the last two or three years been quite pressing, and the result has been not only an increase of work at the various cooperages of the city, but the puttiug up on Brannan Street near the California Sugar Refinery, of one of the finest establishments in the State, where everything is carried on a scale that compared with our former efforts in that direction may be termed almost absolutely gigantic.

The manufacture of packing boxes shows conclusively the status to which our manufacturing business has grown. Over six million feet of lumber from which are made nearly one and a half million boxes yearly, attest the demand for them. This department of manufacture is a kind of test of all the rest, for if they flourish it must flourish, and if they decay it must decay also. All sorts and eizes of boxes from ones an inch cube, to those several feet in length and breadth. Many new machines for splitting, dovetailing, etc., have been introduced into the box factories of this city, and all are the invention of San Francisco mechanics—not indeed ones born here and racy of the soil, but those who have long made it their home, and who desire none other than near the wavcs of the broad Pacific. Another small manufacture, that of Paper Boxes, furnishes the same sort or index to the trade of our dry goods houses, and gives employment to a good many women and boys. The immense number of cigars manufactured keeps two factories of cigar boxes in full swing, and two Last factories are sustained hy our boot and shoe work. The boat-builders of the city have not been flourishing, and that section of our manufactures in lumber is feebly represented by half a dozen establishments, employing one or two men, and they at best drag out a spasmodic existence. Several attempts have been made in this city, to establish piano-forto factories, aud at one time, there were three in existence. All of these have since died out, but a new one has risen up to fill their place. Jacob Zech who ran an establishment on Ninth street about a year ago, really made some splendid pianos, but it was found a very up-hill job to struggle against the prejndice in favor of the old establisbed makers of the East.

The Iron Interests of the City.

And when we say the iron, we mean to include those of all the metallic ores, deserve more than a passing notice. It was not long till the shallow placer diggings of the days of '49 were worked out, and when that occurred, machinery had to be used in the process of further development. Especially were the receipts of machinery made manifest with the discovery of the wonderful mines of Nevada. But at first the demand could not be supplied. Eastern iron founders did not understand our wants, and could not be made to understand them. And even if they did, the expense, danger, and time consumed in transporting heavy iron castings around Cape Horn or over the Isthmus was such as to render Eastern machinery almost impossible to be used in Pacific Coast mines. Hence arise the numerous and important scrics of foundries, boiler shops, machine shops, etc., that so thickly stud a portion of our city. The prosperity of this quarter is a test of the prosperity of the mining districts and of their development, for when things are going ahead briskly the sound of the hammer and anvil, the roar of the furnace fire, and the confused noise of machinery is to be heard night and day, and at early morn and dewy eve the streets adjacent to the IRON QUARTER are filled with busy throngs of happy and contented workmen. Notwithstanding that the

Railroad Development of this Coast

Has only just begun, immense quantities of Rolled Iron have been used, and the future development of the railroad system will cause it to be increased enormously. To supply this want and others connected therewith the Rolling Mill at Hunter's Point has been established, an institution at present employing nearly two hundred hands, and destined to be the parent of many similar ones. Following in the establishment of Iron, came that of Brass foundries, of which we can at present boast of six. One of those is a very large complete establishment, and in addition to the founding of Brass, also makes a specialty of casting bells. And from many a church tower and fire house their melodious or awe-inspiring tones strike on the ear throughout the length and breadth of the coast from San Diego to the Straits of San Juan del Fuca, and from San Francisco to the capital of Mormon Utah. Of the gold and silver manufactures of the city excepting those carried on at the great assaying works on Seventh and Brannan streets, and at the United States Mint, we must speak in terms of unqualified praise. Between them all, they number at least thirty establishments, and their products are worth nearly a million of dollars every year. Cbains by the mile, watch cases, seals, signet rings, brooches, etc., by the bushel, are amongst their products, and the display of silver plate, made at one thcm is unrivalled west of Chicago. A couple of lapidaries are employing a dozen men to cut and set precious stones of every name, size, and hue. Silver plating and gold pen making are specialities, and we have two men competing for the custom to be had in that line of business, when the imported stock of gold pens is exhausted. Our gold and silver refinery is one of the most complete in the Union. All the gold for coining purposes used at the United States Mint is refined here, besides the immense amount passing through private hands. The value of the refined product after passing through is averaged at nearly twenty million of dollars per annum.

The Lead Mines of the Coast

Are bound to be one of its greatest sources of wealth, and for their development much will be owing to the enterprise and perscverance of Mr. T. H. Selby, late Mayor of the city, who was the first to think of establishing lead smelting works on the Coast. Located at Black Point, the works are a conspicuous object even at a long distance and form a notable contrast with their busy workmen, to the bare and desolate sand hills by which they are surrounded. Besides these, Mr. Selby has also a shot tower in the city—the only one west of the Mississippi. Over seven thousand tons of lead are refined, at least six thousand tons of which are exported to the East, and the balance is made into shot and bar and sheet lead. The proprietor has succeeded above his expectstions, and indeed such men as he are deserving of success.

The Manufacture of Glass,

That is bottle glass, has long been carried on with success in this city, though perhaps, not with the success that it ought. The value of the glass of all kinds imported to this coast annually reaches away up into the millions—the trade being sufficiently large to support several flourishing factories. Only one is now in operation, the San Francisco, near the foot of Fourth street. Here all kinds of bottles, flasks, jars, demijohns, carboys, etc., are manufactured, and when running full time, over forty hands are employed. Glass making is one of the most ancient and interesting of the Arts, and our people ought to patronize those who strive to establish it permanently amongst us. Ie it not better to give employment and patronize local industry, than to send to England, France, and Germany for what might as well be made here? The San Francisco factory has struggled against all kinds of difficulties, and has manfully kept on when others have failed. We hope our citizens will give it the aid it so richly deserves. The manufacture of clothing, etc., ought to support

Many Large Establishments,

But it is comparatively speaking small, though it is increasing day by day. Nearly all the boys' clothing used on the Coast is made in San Francisco, but the establishments are as yet only infantile. The major part of tbe men's clothing is however imported, save the rough denim and duck overalls, pants, etc., which are manufactured in this city, chiefly by Chinese. Over a thousand women find employment in making white goods, and a large number in shirt and umbrella making, in the manufacture of straw goods, gloves, caps, and necktics. Hats are manufactured in about a dozen establishments, not more than three, however, being of any size. The value of the production, however, does not exceed annually a quarter of a million dollars. Though we have no standing armies and though our powder for musket, etc., use is mostly imported, yet we have in tbe vicint of our city

Two Powder Factories,

Or rather we should say, explosive factories, one being devoted to the production of the well-known Giant Powder, the other to that of an infant giant—the Young Hercules. It is claimed that these institutions unitedly furnish about $400,000 worth of explosives to the mines, etc., of the coast. The making of artificial stone has been carried on for a couple of years past by two factories, only one of which however seems now to sustain a vigorous existence. This has had great success, which is made evident to every eye by the increasing use of its potent material in forming the projecting portions of buildings. Owing to the

Immense Wheat Crops

Of the last couple of years, and other needs, the making of bags has assumed leviathan proportions. It will at least this year be doubled, and the production of the half dozen factories will certainly be worth six hundred thousand dollars. Hitherto we have received nearly all our wheat bags from England, or Scotland rather, Dundee being the seat of their manufacture. This city, which has a population of over 100,000, has doubled it within a series of years solely by the manufacture of bags from jute. The material can be laid down here at 5 cents per pound, duty paid, and the cotton mill at Oakland has for the last couple of years started into manufacturing burlapa from it, and bags from the burlaps. Within a month or two they have announced their intention of doubling their capital and also their production. In this city the pioneer in the manufacture of wheat bags from burlaps is Detrick of Clay street, who has now upwards of thirty hands employed, and whose factory has a capacity of twenty thousand bags per day. For the future we shall require from ten to fifteen millions of wheat bags annually, probably a great deal more, all of which should be manufactured in this city. With

Our Immense Flocks and Herds

It might be expected that we do something beyond the tanning of leather, and so we do. Eighteen factories are engaged in the manufacture of soap, two or three of the largest having within a couple of years consolidated, and the article produced is of a very superior quality indeed. And the sale of it has been such that import save in the finer fancy kinds has been entirely shut off. This however, has been in no way detrimental in the matter of price, as competition has set in by the establishment of a very large factory at the Mission. Some of the soaps—the scented ones—produced here are extremely fine, and are fit to be used even in the toilet of an empress. The value of the soaps now manufactured in San Francisco, exceeds three-quarters of a million dollars a year. We will probably continue this subject in a future issue.

THERE seems to be some prospect of the much talked of plan of cutting a canal through the Isthmus of Corinth being realized. Negotiations have been entered into between the Greek government and engineers to cut a canal 125 feet wide by 26 feet in depth. Abont half way it is proposed to establish a large inland harbor, with an area of about 90 acres, and spacious warehouses. If the work is ever completed, it will prove a great time-saver to vessels which are now obliged to go outside of the peninsula.

Domestic Economy.

To Cook Egg Plant.

This vegetable is a delicious addition to every dinner, if it ie only cooked rightly; hut there is not much attentiou given to preparing it for au article of food in tho United States, yet in India it is highly prized, and in very genoral uso.

Fried Egg Plant.—Take a largo, ripe, purplo egg, and cut it in slices of half an inch in thickness; strew a little salt over each, and lay on a plate for ten minutes or more to let the water rnn out; then dip each slico into a well beaton egg, aud then iu cracker or hread crumhs, and fry in hot butter or lard as you would oysters, aud the plaat will taste liko fried fish.

Boiled Egg Plant.—Cut tho eggs directly in half and boil as yon would squash nutil perfectly soft and tender; then scrape from tho iuside of tho skins, season with salt, butter, etc.; and strew sifted bread crumbs all over them. Set the dish into tho oven to brown for ton minutes.

Baked Egg Plant.—Wash the vegetablos clean, and bake in the ovon as you would potatoes. Removo the skius while hot, mash to a pasto, and season with hutter, pepper and salt. A raw onion choppped fine and a small pepper, are cousidered great addition to this dish.

Preserving Plums Without Skins.—Pour hoiling water over large egg or magnnm honnm plums; cover them until it is cold, then pull off the skins. Make a syrup of a pound of sugar and a teacup of water for each pound of fruit; make it hoiling hot and pour it over; let them romain for a day or two, theu drain off and boil again; skim it clear and pour it hot ovor the plums; let them remain until the next day, then put tbem over tho fire in the syrup; hoil them very gently until clear; take them from the syrup with a skimmer into the pots or jars; hoil tho syrup until rich and thick; take off any scnm which may arise, then let it cool and settle, and pour it over the plnms. If brown sugar is used, which is quite as good, except for green gages, clarify it as directed,

How to Test the Richness of Milk.—Procnre any long glass vessel—a cologne bottle or long visl. Take a narrow strip of paper, jnst the length from the neck to the hottom of the vial, aud mark it off with one hundred lines, at equal distances; or, if more convenient, and to obtain greater exactness, into fifty lines, and count each as two—and paste it upon the vial, so as to divide its length into a hundred equal parts. Fill it to the highest mark with milk fresh from the cow, and allow it to stand in a porpendicular position twenty-four hours. The number of epaces occupied by the cream will give you its exact percentage in the milk without suy guess work.—*Miss. Agriculturist.*

Canning Grapes.—It is not known to every one that the grape can be put up like other fruits for winter use. But try it and see. There is no fruit easier to manage this way, or that rotains its nstnrsl flsvor and excellence better. Make a syrup of a quarter of a pouud of sugar for one pound of fruit; put the grapes whole into the scalding syrup and skim out soon, and let them partly cool, and tben can them as you would any other fruit. If you wish to have the pulp clear of the seeds, you have only to run it through a colander. Nothing in the line of canned fruit makes a more healthy and palatable pie tban the grape prepared in this way, or with less trouble.

How to Cook Corned Beef.—Tho Boston *Journal of Chemistry* says: The rulo has a Hibernian sound. Don't boil it, for corned heef should never he hoiled. It should only simmer, being placed on a part of the range or stove where this process may go on uninterruptedly from four to eix hours, according to the sizo of the piece. If it is to be served cold, let the meat remain in the liquor until cold Though meat can he made tender by let ting it remain in the liquor until the next day, and then hring it to the boiling point just hefore serving.

Warming Cold Boiled Potatoes.—Slice and put them in a basin with a little milk or water, somo cream if you havo it, and a little salt. Let it remain on the etove until it is thoroughly heated through, stirring often to prevent its sticking; a bit of fish left from a former meal or some heaten egg is a nice addition to it.

Maids and Mistresses.—It ehould be plain enough that examples are as much to servants as to children; since in maunors and social training servants are as children. The peasant-girl reared in an Irish cahin or German cottago can hardly be expected to be a model of politeness or of personal neatness. It is quito possihle, however, to teach hor by example alone. If tho mistress be courteous to every member of her family, aud they in turn to her, the maid soon feels tho atmosphere of good-breeding, and unconsciously becomes amiable and respectful. But let tho mistress speak sharply to hor husband, or scold the children in pnhlic, or let the master constantly find fanlt in the prosence of tho servant, and she will shortly discover that courtesy is not one of tho essontials of the ostahlishment, and will, most likely, add black looks, snd uncivil words to tho general disharmony. Servants heing imitativo, thore is more reasou that tho conduct of employers ho worthy of imitation. If the mistress of a house be careful of her dress, her speech, ber daily hahits, her handmaid will, in all probahility, grow more careful of her own. But the woman who comes to her hreakfast-tahlo with dishoveled hair and rumpled gown, has no right to find fault with the maid for attending, the door-bell in a dirty oalico and slovenly shoes. Like mistress like maid, as well as like master like man. Unless a good exsmple he set, there is no cause to complain of servants for following a had one. As a rule, tbey are ready to loarn, tbough they may he dull and slow of comprehension. They would rather improve their condition than degrade it. They would rather he ladies than servants. Their ignorance makes them mistske the false for tho true, the bsd for the good. If every mistress would take pains to set a fair example to ber maids, and aid tbem now and then by timely aud delicate hints, she would eoon have servants who would be, in fact, the help they are in name.—*Scribner.*

Cooking Peas.—Au English psper says: No vegetable depends more for its excellence upon cooking than peas. Have them freshly gathered and shelled, but never wash them. If they are not perfectly clean, roll them in a dry cloth; but this is seldom required, and then only through carelessness. Pour them into the dry cooking-dish and put as much salt over them ss is required; then pour on boiling water enough to cover them; boil them fifteen minutes if they are young; no pea is fit to cook which requires more than half an hour's hoiling. When done, put to a quart of peas three tablespoonfuls of butter snd pepper to your tsste. Put all the water to them in which they were boiled. The great mistake in cooking peas is in cooking too long, and in deluging them with water.

To Pickle Small Cucumbers and Gherkins.—Choose small, perfect gherkins, or cucumbers; spread on platters, mix a small bit of alum, pulverized, with salt, and cover them; let them lie in this a week. Then drain them, put tbem into a jar, cover them with boiliug vinegar, and cover in thick with grspe leaves. Set them near the fire. If they do not become tolerably green after au hour or so, pour the vinegar into another jar, set it on the hot range or hearth until too hot to bear your hand in it, but do not let it boil, then pour again over the pickles, cover with fresh leaves; repeat this until tbey are as green as you wish.

Tomato Preserves.—Take the round yellow variety as soon as ripe, scald and peel them; then to seven pounds of tomatoes add seven pounds of white sugar, and let them stand over night. Take the tomatoes out of tho sugar and hoil the syrup, removing the scum. Put in the tomatoes and boil gently fifteen or twenty minutes; remove the fruit again, and boil until the syrup thickens. On cooling put the fruit into jars and pour the syrup over it, and add a few slices of lemon to each jar, and you will have something to please tbo most fastidious.

Asparagus.—Cut this when two inches high, run the knife under the ground three or four inches. Put it in cold water as you scrape it off. Put it in a hag for the purpose, and boil it hard twenty minutes, or longer if reqnired. Put drawn butter over in a covered dish, and you have the nicest of all epring vegetahles. If you want it to grow large, press a large mouth bottle over tho first shoot, and press dirt around it. It will grow to a larger size and bo tender.

Good Health.

Artificial Fibrin as a Diet.

Dr. John Goodman, in a communication to the *British Medical Journal*, says of artificial fihriu: "As a member of tho British Medical Associatiou, aud in the common interests of humanity, I have much pleasuro in calling attontion to my discovery of this new dietetic substance. So far as I havo employed it, it promises fair to he invaluable in medical practice, especially in cases of feehlo alimentation and deficient nutrition, and second to none in those cases where rejectiou of food forms a prominent featuro, or where tbo appetito snd digestivo powers are reduced to a minimum. As fihriuous material, it is of courso highly uutritious, aud eminently adspted to all cases whero there is a doficiency of fihrin in the hlood. It is, perhaps, unparalleled in its qualities of lightness and digestihility, and is, moreover, a grest delicacy. In many urgent cases of rejection of food, otc., it not only remains where an ogg otherwise cooked would not ho tolerated, but its presence in the stomach has been found to create a feeling of want rather than of superfluity, and to promote rather than decrease the sppetite for food.

The production of this suhstanco is within the reach of every sick room, and is effected with great facility. It is formed hy exposing alhuminous material to the operation or influence of cold water, for a given period; and on sccount of its great plenteousness we employ the ordinsry hen's egg for its production. When the shell is hroken and removed, aud its contents are immersed in cold water for twelve hours or eo, they are found to undergo a chemico-molecular change, and to become solid and insoluhle. This change is indicated hy the assumptiou, by the transparent white of the egg, of an opaque and snowy wbite appesrance, which far surpasses that of an ordinary boiled egg. The product, and the fluid in which it is immersed, must now be submitted to the action of heat to the boiling point, when tho fihrin will he ready for use."

The Titusville *Herald* says that asthma is of very rsre occurrence in the oil regions, and tbat the cause of such exemption is found in the fsct that the atmosphere there is thoroughly impregnated with the vapore of petroleum, which act almost as a specific for the relief of astbma, and at the ssme time as a preventive of consumption. It adds: "Let anyone who is afflicted with astbma, and feels a particularly difficult spell of breathing coming on, go in the vicinity of a produciug well, where petroleum vapor hovers in the neighborhood, and he finds a great relief, and continued presence in such a neighborhood, will be the best means of a permanent cure."

Nutritive Properties of Apples.—It is etated thst by a careful analysis it has heen found that apples contain a larger amount of phosphorus, or brain food, than sny other fruit or vegotable, and on this account they are very important to sedentsry men who work their hrains rathor than their muscles. They also contain the acids which are needed every day, especially for sedentary men, the action of whose liver is sluggish, to eliminato effete matters, which, if retained in the systom, produce inaction of the brain, and indeed, of the whole system, causing jaundice, sleepiness, scurvy, and troublesome diseases of the skin.

Felon on the Finger.—The following simple prescription is recommended as a cure for felon on the finger. Take common rock salt, such as is used for salting down beef or pork; dry it in an oven; theu pound it fine; and mix it with spirits of turpentine in equal parts; put it in a rag and wrap it round the parts affected, and, as it gets dry, put on more, and in twenty-four hours you are cured—the felou will be dead. It will do no harm to try it.

Cure for Summer Complaint.—Take about two tablespoonfnls of grated comfrey root and tho white of one egg, beaten well together; then have ready a hoiling pint of milk, into which stir the comfrey and egg. It will thicken like "pap," and it is not unpleasaut to take.

Cider and Red Pepper for Measles.—I have never seen it in print that cider will drive out the measles when they havo etruck in, and as I know it to be a good remedy I think it ought to be published. —*B, in New England Farmer.*

Useful Information.

How to Harden Steel Drills.—It is uot generally known that steel can be made so hard that it will pierce any known suhstauce but a diamond. Mauy jewelers and lapidaries have great trouhle in getting the points of thoir drills hard enough to pierco an amothyst. For the benefit of miners and others using drills that require a hard point, wo rocommend the following manner of manipulation. The drills should bo held, if small, hy hot pinchers or tongs, whilo temperiug. First heat the tool to a whito heat, and tben pross it into a stick of sealing-wax; leave it hut a secoud there, and then stick it into tho wax in another place. This operation is rapidly repeated until tho graver is too cool to enter the wax. In turning or drilliug, tho tool is moistened with oil of turpentine.

Waterproof Paint for Canvas.—The following is a cheap and simple process for coating canvas for wagon tope, tents, awnings, etc. It renders it impermeable to moisture, without making it stiff and liahle to hreak. Soft soap is to be dissolved iu hot water, and a solution of sulpbste of iron added. The sulphuric acid combines with the potssh of the soap, and the oxide of iron is precipitated with the fatty acid as insoluble iron soap. This is washed and dried, and mixed with linseed oil. The addition of dissolved India ruhber to the oil improves the paint.

A Teaspoonful of ammonia in one gallon of warm water will often restore the color of carpets, even if produced hy scid or alksli. If a ceiling hss been whitewashed with carpet down, and a few drops are visible, this will remove it. Or, after the earpet is well beaten and hrushed, scour with ox gsll, which will not only extract gresse but freshen the colors. 1 pint of gall in 3 gallons warm water will do s large carpot. Table and floor cloths may he thus washed. The suds left from a wash, when ammonia is used, oven if almost cold; cleans these new floor-cloths well.

Cayenne Pepper for Bugs.—W. Lynn, a farmer of Monroe county, Ohio, has succeeded for many years in driving awsy cucumber and squash bugs from his vines, by dusting common cayenne pepper upou them while wet with dew in the morning. He repeats the operation once a week, and finds five cents worth of pepper sufficient to keep his cucumber, melon and equash vines free during the sesson. He has recently tried it upon the new cabhage worm with success.

Artificial Indian Ink.—By mixing lsmpblsck with ten times its weight of sulphuric acid (sp. gr. 66° Beaume) and allowing it to stsnd for some hours, and then washing out all the acid, the material acquires the power of mixing readily with water, and possesses all the properties of genuine Indian ink.

Varnish for White Woods.—Dissolve three pounds of bleached shellac in one gallon of spirit of wine; strain, and add one and oue-hslf more gallons of spirit. If tho shellac is pure and white, this will make a boantifully clear covering for white wooden articles.

Sizing for Lace Curtains.—Mske a strong solution of four parts of borax, iu hot water, to which add twelve parts of white shellac, and three parts cf starch and isinglass, the latter two heing first reduced to tho form of a jelly by hot water.

Rendering Boots Waterproof.—Boil one quart of linseed oil with half a pound of Venice turpentine, with which paint the leather froquently whilo warm, hut not hot, till the leather will ahsorb no more. Afterward apply any kind of blacking.

A Correspondent of the Detroit *Tribune* says:—"If an edge tool is so hard as to crumble, grind it on a dry stone until the edge turns blue; it will then cease to break and the temper will generally prove to be about right. Scythes and axes are sometimes too hard at the edge, but if treated in this way will give no farther trouble.

To Restore Color.—When color on a fabric has been accidently or otherwise destroyed by acid, ammonia is applied to nentralize the same, after which an application of chloroform will, in almost all cases, restore the original color. The application of ammonia is common, but that of chloroform is but little known.

To Remove Paint.—Choloroform will remove paint from a garment or elsewhere, when benzol or bisulphide of carbon fails.

BLANKETS *vs.* CONCENTRATORS.—The Keystone Consolidated Mining Co., located at Amador, Amador county, Cal., have recently taken ont the blanketa in front of the hattery and snbstituted twenty of Hendy'a concentratora. Sixteen of the concentrators take the tailings direct from the hatteries and the remaining four re-concentrate the pulp from the sixteen. The latest report from the mine is that they do away with the lahor of six or seven men who were formerly employed with the huddlea and hlanketa, and in addition the concentrators save ahout half a ton of sulphurets daily.

THE STEETKIN RIVER mines, of which little has heen heard for some time, are again attracting attention. There is great excitement at Porta Wrangel and Tongas over the mines discovered 245 milcs from Tongas. The diggings are in a creek that empties into a lake 70 miles from the Steetkin river, ahout 80 miles from the head of hoat navigation in the latter. Some 23 mincrs are at work there now, aud are said to he making from one to fonr ounces per day to the hand. If half of the reports of this locality prove true the mines muat hs rich in orea.

THE NEW diggiugs helow Oroville are attracting 700 or 800 Chinamen per month by the cara and crowds of them are flocking thither hy other means. The Chinamen will make good wages at diggings where white meu would atarve.

THE new quartz mill for the Gold Tnnnel mine near Grass Valley has heen completed. It is to he run by water power, and will not commence operations until the rainy season starta iu; meanwhile rock from the mine is accumulatiug on the dumps.

THE Petaluma foundry is huilding an addition for the mannfacture of more stoves.

Quicksilver Mining.

Progress in Napa, Lake and Sonoma Counties.

But few of our readers are aware of the extent to which prospecting and mining for the ores of mercury has besn carried on during the past year in the coast counties lying to the north of San Francisco Bay, and particularly in that portion of the coast range lying on the eastsrn slopes of the St. Hslena range, in the counties of Sonoma, Lake and Napa. A large part of the section rsferred to has bsen well prospected, and many new and promising minea have heen discoversd. Our friend, W. A. Skidmore, who made a trip through that region recently, furniahes ns with some interesting ohaervationa concerning the quicksilver mines, which ahow that the mines in our northern coast counties may yet equal older and "more famous one", hoth here and elsewhere.

The renewed euergy infused into tbia branch of mining may he attributed to several causes, prominent among wbich we may mention

The High Price of Quicksilver,

Caused hy a combination of leading capitalista in the principal marts of the world, for the purpoae of diminishing and controlling the supply and keeping np the prics of the article. Under the influence of this combinatiou the price of this much-ueeded product, on which ao much of the material prosperity of our State dspeuds, has heen run up from 75 cents to $1.10 psr pound within ths past eighteen months. Under the influence of this combination the total product of the Nsw Almaden was, a few years since, "farmed out" at 40c. per pound, while the article readily commanded in the hands of the monopolists 75 cents per ponnd, and a large portion of the product was sold at $1 per pound, to the disgust and indignation of the duped stockholders. As a part of this gigantic combination, shipmenta were made to China, where it waa sold at the cost of production, thereby forciug the re-ahipmeut to Europe from that couutry of the products of the Spauish Almaden, and throwing the trade in the hands of a mouopoly.

The Supply in the United States and Europe.

It ia estimated that the demand from the Pacific States alone exceeda 100,000 pounds per month, exclusive of the demand for export to Mexico, South America aud Chiua; and it will not he long hefore Japan will develop its vast mineral resonrces and hecome one of our most profitahle customers.

Again, there has heen a material falling off in the supply from Europe, cansed hy the civil war in Spain, which has closed the famons Almaden, worked for centuries, and yet apparently inexhaustihle. Added to this, there is an increased demand for ita nse in the arts, as well as the increasing exactions caused hy the development of the vast mineral region extending from the Rocky Mountains to the Pacific, and from British Columhia to Mexico. Thia, with the irrepressible energy of our prospectora and the confidence and venturesome spirit of our leading capitalists, haa promoted the discovery, exploration aud development of mines which promise to rival the Almadens and Idrias of hoth the Old and New World.

A few observations on the mode of occurence and

Characteristics of Ores of Mercury

May not he inappropriate. Mineralogists divide these ores into three classes: Native mercury, ocenring in pockets and glohules, generally in a shaly formation, and found to a greater or lesa extent in all quicksilver mines; cinnahar, when pure, 86 mercury and 14 sulphur, hut freqnently mixed with earthy matter, and fallow ores of mercury, containing variahle proportions as: Copper 30 to 39 per cent.; iron 2 to 7; mercury ¼ per cent. to 16 per cent.; antimony 25 to 33 per cent.; aulphur 20 to 25 per cent. The latter class of orea are apparently rare in California, hnt are extensively worked in Hungary, hy a rude proceas described in Crookes & Rhorig's "Treatise on Metallurgy" and yield a fair profit on ores containing only *one-fourth* of one per cent. mercury.

The Principal Producing Mines of the World

Are the Almaden of Spain, the Idria of Austria, and the New Almaden of California. Our State also contains other mines of note, such as the New Idria, Guadalupe and the Redington or Knoxville. These have materially added to our local prodnction, nntil the closing hy protracted litigation of the New Idria. Tbis deficit in production will soon he more than counterhalanced by the development of the Great Western of Lake Connty.

The Almaden of Spain has worked since a period of remote antiqnity, so far that "the memory of man runneth not to the contrary" with the exceptions of intsrvals of inactivity from wars aud civil disasnsions. Ths ores occur in argillaceous scbists and aandstones, and the greatest depth attained up to tbe closing of the miue was 1,200 fset. There, as in the miusral belt of Lake and Napa counties, the porphyritic eruptions (of which Mt. St. Helena is ths culmiuating point) seem to havs volatilized the mercury which has heen condeused in the vein mattsr, and its overlying strata in the form of cinnahar and native mercury.

The Idria, of Austria, haa heen profitahly worked for nearly 400 years, and haa attained a dspth of from 500 to 750 feet bslow the aurfacs. Ths ores occur in talcoss and argillaceous sbale, associated with a hituminoua sbale containing glohulea of native mercury, wbich drop on ths tunnsl floors during the process of extraction. Several specimens of precissly similar characteristica have heen shown to us hy Mr. Skidmors, to whom tbey wsre pressuted, by Mr. Wm. Rousch, of Placer Co., obtained from a mine in Napa County. The occurrence of native mercury has heretofore been erroneously considered as an evidsnce of unstability of minea producing such ores, hnt a rsview of the history of the leading mines of Europs will demontrate that this feature ia inseparahle from all great quicksilver minea.

Our own Nsw Almaden occurs in a serpsntine and steatitic formation, similar in many respecta to the Great Western of Lake county. The history of the dsvslopmsnt of this mine and its statistics of production are familiar to or readily attainahle hy our readers.

The travelsr or plsasure seeker throngh

Our Northern Coast Counties

Cannot fail to observs, from any portion of Napa Vailsy, the bold prominent landmark, known as St. Heleua Mountain, situated at the head or Napa Valley, and rising to an altitude of nearly 4,500 feet. This mountain, itself an eruption of porphyry and tracbyte, is flanked hy bigh ridges and cliffs of metamorphic aandstoue, not unlikein appearance from a distance the hasaltic Table Mountains of Butts and Tuolnmne counties. To the sast of this range runs a belt of serpentine, cutting the spurs of the main range and prsssrving its uuiformity for many miles in a north and south course. Ou this hslt ws fiud many of the prominent quicksilver mines of ths northern Coast Range—among others the Redington, Phœnix and Great Western. The general characteristics of the country were recently described in the MINING AND SCIENTIEIO PRESS, accompanied hy a diagram, and a repetition here wonld be uaeless. Limited time afforded Mr. Skidmore an opportunity to visit but one of this group of mines—the Great Weatern—of which he gives us the following details picked up during a few hours' visit.

The Great Western Quicksilver Mine

Ia aituated on the east slope of the St. Helena Range at an elevation of 2,200 feet ahove sealevel and about 1,000 feet ahove St. Heleua Cañon—distant 16 miles from Calistoga. The mineral hearing matter haa a width of from 30 to 50 feet and consists of a serpentiue and talcose formation, associated with cblorite and shales, the whole mass irregularly impregnated with cinnahar and containing orea of various grades, from one per cent. to pure cinnahar. The ground haa heen explored for a length of 1500 feet hy numerous tunnels and a large proportion proved to be mineralized to a profitahle degree. The workings of the mine through the varioua tunnels, which attack the ore body at right augles to its course, bave satisfactorily demonstrated its continuity and richness for more than 1000 feet in length and an average depth from "grass roots" to floor silla of lower tunnels of 150 feet—leaving apparently the hest ground under these floora, to be developed hy shafta.

The Ore Body

Has heen tapped hy eight tnnnels. Four of these—the upper tunnels—may he cousidered as mere prospecting tnnnels, though availahle for the extraction of surface orea. Of the fonr lower tunnels, the main adit, No. 8, attacks the deposit from the aontheast aide, running nnder a ridge 100 feet higher than its mouth, and connecting (when completed) hy means of a main drift with three lower tunnels on the other side of the ridge. When thia work ia completed, the entire product of the mine will he run out through this tunnel, in cars, over a tramway nearly 1,000 feet in length, to the ore-chute, where it is dumped on the feed-floor of the furnace, 100 feet helow, therehy saving handling and hauling of the ores.

Pendiug the completion of this work, the tunnela on the other side of the ridge are heing vigorously driven on the ore-deposits, and a ahaft is heing aunk on No. 8 for a new level, and "raising" to surface is progressing. No extensive and rich chambers or deposits have as yet heen struck. The entire mass ia permeated with veins of cinnahar, alternately contracting and expanding, hut showing the remarkahle feature of a uniform and continnoua wideniug with depth. In fact, in all the faces of the various drifts and tunnela, the facea look better on the floor than on the roof. This indicates that the present deposita are stringera or exfloreacencea of larger depoaita. These stringers are sometimes mere seams, hnt are nowhere ahsent in any part of the worka, and in aome parts have an expanaion of five to ten feet.

The property was acqnired a year since hy a few ahrewd capitalista of Sau Francisco at a cost of ahout one-tenth the same prospect would now command. They have quietly and steadily proceeded in its development, having expsuded some $50,000, aud are uow about to reap the reward of tbeir psraeverance and sntsrprise. But few except ths ownsra have known of the existence of a property which at uo distant day will compete in production with the New Almaden and Redington.

The Furnace,

Recently completed, and now heating up for the first run, waa huilt on the plans of Riotte and Luckhardt, and haa a capacity of from ten to twslve tons psr 24 houra. They are provided with donhle seta of condensers with capacity sufficient for running another furnace of equal size, which will no doubt soon be erected as even now the ors supply will exceed ths facilities of reduction. The ohject of two aets of condenssrs ia that one may cool while the other is in opsration, tberehy insnring continuous runs. The compauy own asveral hnndred acrsa of wsll timhered land and are receiving wood at $2.50 per cord. Mr. Luckhardt eatimatea the cost of treatment of orss at $1.25 to $1.50 per ton, and the loss of quickailver at from five to six per cent. of the average aasay of the ores. Forty-sight minera (Cbinese, with whits overssers) are smployed, at an expenae of $1.50 per day each, and give aatisfaction. Under all theae circumstances, taking into consideration cheapneaa of labor and fuel and convsniences for extracting and deliveriug ore from so vast a deposit, it would seem tbat a fair profit may he made on one per csnt. ore, and a large revenne derivcd by ths conatruction and operation of another furnace of equal capacity even on thia low grade of ore. However, there is no rsaaon to suppose the average yield will rnn hslow two and a half per cent., and even five per cent. may be looked upon aa reasenable. Ths extent of supply ia practically unlimitsd for many years uuless the rsducing machinery ahould be largely increassd. The appliancss of tbe mins ars first-claas and show the exercise of skill, experisnce and judgmsnt in planning and execution. This is manifest in tbe construction of furnace, chutss, roada and handling of water. To use a common, hut expressive phrase, the owners "mean husiness."

CORNUCOPIA.—Conflicting reporta coucerning the Cornucopia mining district continue to he received. The Humboldt *Register* is down on it, and ao are asveral othsr papera and nnmerous correspondents. The Elko *Independent*, however, ia aanguine over the prospects of a rich camp and aaya: Almost everybody who has viaited these mines and returned appears satiafied, hut, as must he expected, it is utterly impoasihle to anit all, and occasionally you will find a man who would not he satiafied if he found a mine that would produce twenty-dollar piecea in an unlimited quantity, and anch a one has tnrned up in the delegation that went from Austin. He returned aud says he could see nothing there to amount to anything, and he never knew of ao little merit exciting so much commeut and giving everyhody the fever. On tbe other hand, where there is one man dissatiafied, there are twenty highly elated at the proapect.

NEW HYDRAULIC PRESS.—Anthony V. Ojeda of this city, Chief Engineer of the steamer "China," has invented and recently patented a valuable improvement in hydraulic jacks. The improvement ia in that claas of hydraulic pressea which have the plunger, piaton, operating valves and mechanism, and the necesaary liquid all contained within the outer cylinder, which is easily portahle. It conaists mainly in the novel construction of a plunger to he moved within the cylinder, which plnnger is provided with a central hore for the operating piston, and also with certain paasagea ao arranged that water ia taken from ahove the plnnger and forced helow it by means of the piston, with the use of ouly one valve. The piston is so conatructed, with a projection helow, that when it ia forced down to the lowest point it will open the valve and permit the water to eacape from helow to the apace above it, after having done its work. Those who are familiar with the hydraulic jack will at once see the natnre and advantage of the invention.

THE Yreka *Union* aaya that the mining newa from Oak Bar is encouraging. There are now aome eight claims in full hlast and doing well. The Delaney claim is payiug heat. On one day of last week they took out 28½ ounces; the next day, 37 ounces, and the day following 36¼ ounces. The claim is shortly to he worked night and day with a force of 25 men.

ABOUT 40,000 sacka of ore from the Little Cottonwood mines are said to he awaiting transportation at Sandy Station on the Utah Sonthern Railroad.

THE Salt Lake amelters are said to he running short of fnel, and it ia feared that some of them will he ohliged to suapend operations temporary.

A New Leveling Rod for Surveyors.

In the regular work of the Coast Survey on this Coast, but more particularly in some special examinations connected therewith, it became patent that the ordinary wooden leveling rod was inadequate to give perfectly reliable results. The defects are inherent in the instrument and the principal ones are—(*a*) inaccuracy of graduation; (*b*) uncertainty of the standard with which (if ever) it was compared; (*c*) no rate of expansion of the rod for changes of temperature; (*d*) no knowledge of the effect of hygrometric changes; (*e*) no means in the rod itself for adjusting the verticality; (*f*) no tangent motion.

For all ordinary work of leveling the best made rods are sufficiently accurate; but where investigations are to be made for the coefficient of refraction, so important in the hypsometrical work of large triangulations, they do not afford the desired precision. In the reference of the mean level of the sea, at any point where years of continuous tidal observations have been made to some well-marked bench mark, the utmost precision is demanded, because by such observations through a series of years or of centuries, we shall be able to measure the rising or the subsidence of the shores of the continent. When the hypsometrical work of a triangulation is carried across the country with the same precision as that of the sides and geographical positions, future observers will be able to determine the changes, if any, in the elevation of the interior of the continent.

To effect this, Prof. George Davidson, of the U. S. Coast Survey, has devised a three-sided, hollow, rectangular metal casing, to fit over the graduated part of the "Boston Rod," which he described at the last meeting of the California Academy of Sciences. The casing described is made up of three side and two end pieces of bell metal planed to the thickness required and brazed together. After all mechanical work upon it is done, the graduation is made and compared with the same standard of the United States as the measures of length are compared with. Its standard length is therefore determined for a specified temperature.

The casing devised by Prof. Davidson fits over the front sides and ends of the front part of the ordinary rod, and is secured only at the bottom, so that it is free to change its length by changes of temperature and is guided at the upper end by studs standing through in slots. The extent of graduation is the same as that of the ordinary rod, and the verniers read to 0.001 feet, although they could be made to read to 0.0001 feet. To determine the temperature of the casing, a thermometer is set in a long slot in the front part and the thermometer is read at each reading of the rod.

That the rod-man may be able to keep the rod vertical, two small circular levels are attached to the back of the rod, one for the direct and the other for the inverted position. The ordinary back part of the rod is retained, and this compels the assumption that the change of its length between any two sights on account of change of temperature is inappreciable; and this will virtually be the case in all except extraordinary changes of temperature, and even their effect will be much less than ordinary errors of observation. In addition to what has already been described, Prof. Davidson has also added a tangent screw which he will exhibit and explain at a future meeting of the California Academy of Sciences.

The *Silver State* says that the mills of the Arizona Mining Association, on Buena Vista Creek, near Unionville, were shut down recently for want of water. There is no lack of water in the creek at a point above the mills, but it is appropriated by gardeners. The *Silver State* justly remarks that the labor of the number of men at present idle on account of stoppage in milling and mining is worth more in one month than all the vegetables raised along the creek during the entire season.

Jumping Claims is all the rage at Coruucopia, and prevents extensive prospecting at present. A Mining Vigilance Committee has been formed, however, which will probably put a stop to jumpers.

The New College of Letters of the University of California, at Berkeley, has been completed and will shortly be turned over to the University by the contractors. The College of Agriculture building is nearly finished.

The Discharge in Dry Crushing Batteries.

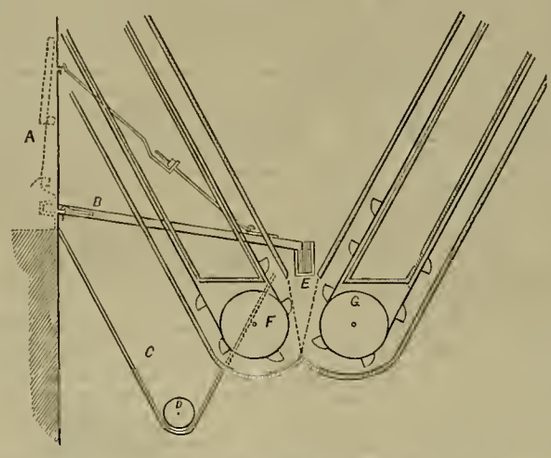
The author of Mining Statistics of California and Nevada justly remarks that the efficiency of dry crushing batteries may be greatly increased by providing more effectually for the discharge of the ore, which is pulverized much faster than it can pass through the screens, as they are usually arranged. One of our correspondents, "C. H. A.," pending the advent of a better invention, sends us a description of a plan which he has used with advantage, and which may be of use to some of our readers. He first saw it in Mexico, and thinks it was invented by a Frenchman who was employed at the mill. The mortar used was a common wet crushing one, discharging only in front, and the work done was over one ton of heavy ore per stamp in 24 hours through a No. 40 mesh wire screen, against 0.6 ton per stamp in a neighboring mill, where the battery discharged on four sides.

In the open front of the mortar was placed, instead of the usual fine screen, one of 10 meshes to the linear inch through which the ore was discharged very fast, falling upon an inclined apron, about five feet long, and as wide as the front of the battery. This apron was formed of 40 mesh wire gauze, stretched upon a frame hung to the battery posts by hooks and staples at one end, and by long rods of iron at the other end, with an inclination from the battery sufficient to cause the ore to pass over it without other impulse than the jar of the stamps, which had from 10 inches to a foot drop. The greater portion of the ore, after passing through the No. 10 mesh screen, was fine enough to go through the apron into a box below, from which it was taken to the furnaces for roasting; while about 10 per cent. of it passed over the apron into another box, and was removed by the feeder to be returned to the battery mixed with fresh ore. In large mills, conveyors and elevators could be used to return this coarse stuff to the battery, and where the mortars discharge on two sides, very rapid crushing might be done.

By referring to the accompanying cuts the plan will be seen. In Fig. 1, *A* is the battery post; *B* is the apron; *C*, the receptacle for fine ore passing through the apron; *D* is a screw-conveyor; *E*, a trough attached to the apron and delivering the coarse matter to the elevator *F*, by which it is returned to the battery. *G* represents another elevator to remove the coarse stuff, when it is not desired to return it to the battery. It may be worked raw or thrown away, while the fine portion is conveyed by the screw, *D*, to the roasting furnace. Fig. 2 is a plan of the apron with screw beneath and elevator drums.

The ore which passes through a No. 40 screen on this plan, is not so fine as when the screen is placed upright, or nearly so, in the mortar, but it is fine enough for roasting in most cases. In addition to the advantage of a free discharge, it will be found that some ores can be concentrated by this method; for, as our correspondent states, the rich portions are generally pulverized first and finest; the stuff which passes over the apron is much poorer than that which passes through, and in some cases may be found poor enough to throw aside, instead of returning it to the stamps. Our correspondent says he has found this plan quite successful, and if some of our readers will try it we would like to see the result published in the Mining and Scientific Press.

Fig. I.



South American Mines.—An Associated Press dispatch from New York says that the South American news received announces various mining discoveries in Ecuador. A quicksilver mine has been discovered not far from Guayaquil. In Chile a bed of coal, it is said, has been discovered on the island of Chiloe, forty yards deep, exceeding in richness any in England.

A great discovery has been made of silver deposits in the desert of Atacama, at a distance of fifteen leagues from Chanaval. The ore is said to yield from eight hundred to one thousand marks per cajon. At Copiapo the excitement rose to an extraordinary pitch, and all the towns in that region were likely to be left nearly deserted of their inhabitants.

Later advices announce the discovery of five more veins of great richness. Such are the crowds of people starting for the new mines, that at Copiapo as high as one hundred and fifty dollars has been paid for a single draught mule. In the Corcobado mines, La Descenta, La Flor del Desierto, La Cantiva, La Descubridora, and Bueno Esperanza mines, alone have during the first six months of the present year, paid wages to 3,598 workmen. They have worked 1,058 metres, which yielded 45,782,945,782 kilogrammes of ore.

PLAN OF ELEVATORS AND SIEVES FOR DRY CRUSHING BATTERY.

Patents & Inventions.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., September 2d, 1873.

For Week Ending August 19th, 1873."

Table-Leaf Supporter.—Edwin W. Perrin, assignor to W. E. Weldon, Portland, Oregon.

Horse Hay-Fork.—Samuel B. Bowen, Stockton, Cal.

Medical Compound.—Peter H. Steenbergen, Chico, Cal.

Veneer Keg.—George W. Swan, S. F., Cal.

———"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Gold in San Francisco.

Regularly, every year or so, we indulge in a mining excitement, in San Francisco, over auriferous ledges discovered on the peninsula, but as often do the fortunate (?) locators find out that they are of no value. The latest find of this sort was at Bernal Heights, near the San Bruno Road. An "experienced miner" washed out a panful of the crushed rock, and pronounced it rich. How strange it is, that with all the "experienced miners," locators always get hold of some numskull, who can't tell mica or pyrites from a real color, or quartz from slate or any other kind of rock.

In this instance all the bright visions of prospective mills, hoisting works, shafts, tunnels, etc., winding up with certificates of stock, and piles of coin, were dispelled by the following report of Mr. Henry G. Hanks, the well known assayer, by whom a sample of the "ore" was tested: "The mineral is the ordinary metamorphic rock of which the peninsula of San Francisco is so largely composed, a formation which is very unlikely to contain gold; the shining yellow particles are superficial, and dissolve readily in nitric acid, which is a positive proof that they are not gold. Under the microscope they have a striated appearance, as if having been rubbed on, which leads to the suspicion that the rock has been prepared to deceive some person or persons. The rock, pulverised and carefully washed, revealed under the microscope particles of chalco pyrites, iron pyrites, and a yellowish transparent mineral (peculiar to the coast range, and which is probably yellow quartz), but no gold."

The Ochoco mines did not have water enough to get out the gold or gold enough to bring in water, so they "fizzled" as many other mining camps have done before them under similar circumstances. It is but just to say, however, that reports conflict, and some half dozen men are yet at work there and said to be making from $4 to $7 per day. They work at a disadvantage, taking out the dirt in dry gulches and carrying it to water where it is washed in rockers.

The Eureka District mines are looking better than ever and the facilities for producing bullion are being increased. The *Sentinel* gives the following as the bullion shipment for the several companies for the month of August: Richmond Company, 971,420 pounds; Eureka Consolidated Company, 860,563 pounds; Ruby Consolidated Company, 40,589 pounds; K. K. Consolidated Company, 150,000. Grand total, 2,432,692 pounds.

It is reported that rich deposits of silver have been discovered in Utah, 20 miles south of the Union Pacific station at Green river. No regular defined vein was discovered, but the ore is in pockets.

High Freights.—The principal shippers to Salt Lake City are preparing to present to the Government Directors of the Union Pacific Railroad a protest against the high freight tariff.

The machinery for running the pumping and hoisting works of the Magenta mine, Grass Valley, is now in full running order.

Large quantities of ore, intended for shipment to the East, are being held back in Salt Lake, on account of the high freight tariffs.

Narrow Gauge Vindicated.

[Continued.]

In last week's issue we gave some facts collated from the late report of the Denver and Rio Grande railway, upon which was based a plea for the narrow-gauge. Taking up the thread, we notice that the power of the narrow-gange locomotive is not affected by the narrowness of the track. This power depends upon the amonnt of weight placed upon the driving wheels of the locomotive, which may he increased as desired,—in other words, as the size of the train requires it. Practically throughout the United States it hae not been found desirahle, except on unusual grades where special power is used, to increase the freight train above what a 30-ton locomotive will draw. While the narrow-gauge road with the same weight of rail can of course carry any weight of locomotive that the wide-gauge can, yet even with a very much lighter rail than that usually adopted on railroads in the United States a 30-ton engine can he used without difficulty on the narrower road, hy increasing the number of driving wheels which carry the 30 tons over the track. In consequence of the reduction in dead-car weight, euch an engine will draw, as has heen shown, 35 per cent. more freight than it can, taken with the present style of rolling stock, ou wide-gauge roads; or, a locomotive weighing 23 tons on the narrow-gauge will carry as much ae one of 30 tons on the other. It is true the uumber of driving wheels could he increased on the wide-guage engine, enahling lighter iron to be used without diminishing the train helow its hest practical size; but the heavy passenger and freight cars of the wide roads (each of which weigbs more than the heaviest present locomotive on the Denver and Rio Grande Railway), and the fact tbat thousands of these machines pass over the line, since a railroad will have say 20 times as many cars in motion as of locomotives, will practically prevent this advantage from heing realized to any considerable extent.

On the Denver and Rio Grande Railway the present passenger locomotive weighs 12½ tons, and the freight locomotive 17⅞ tons. They are more powerful than are needed ordinarily for the preseut eize of the daily through freight train and passeuger train, and for the local mixed train. On occasions where there is a temporary excess of freight an extra engine is run. When the daily through freight husiness increases, so as regularly to exceed the capacity of the present locomotives, heavier ones will be put on up to 30 tons. Practically, on any road (except in the case of special inclines), the loss from broken links, smashed drawhars, injured freight, etc., hy switching with a train that a 30-ton locomotive cannot handle, ie greater than the expense of running an extra engine; or, if the grades are light, so that the numher of cars would be too large, an extra train. Freight trains, where there is a large husiness, are consequently run in fleets, the train unit having reached its practical maximum limit.

Alternatives.

Why not alter the rolling stock on the broad-gauge-road? Because there are so many hundred thousand cars that it is impracticable. The principal cost of chauging the gange of a road is the alteration of its rolling stock. The process of reforming tbe cars could not he gradual, because the uew, light and lower cars would either he knocked to pieces hy the other heavier aud higher ones, or require to be run in separate trains, which is impracticable. Tbese roads are at the mercy of the heaviest cars, or the most vicions model that any other and perhaps distant road may have introduced, otherwise they could not bo run through. All new cars had to he heavy enough to resist the momentum of these, and thus the evil has gone on increasing.

Why not adopt the reformed cars on a new road adhering to the wide gauge? Because the great advantage claimed for adhering to the gauge is simply the avoidance of transbipment, aud this could not be gained practically, because the cars of other companies could not he carried unless in separate trains, which is out the question, and the new, light cars could not he run off their own liue with any advantage.

The Cauge Adopted.

Well, admitting all this to be true, aud that a narrower gauge than 4 feet 8½ inches is advisable, why adopt specially tbat of 3 feet? The Denver and Rio Grande Railway was the pioneer of the new movement in the Uuited States, and, so far as known, constructed the first road of 3 feet gauge in the world.

From the experience already had on the Festiniog Railroad of Wales, it was known that the heaviest class of freights—coal, iron, lumher, ores, stone, etc.—could be advantageously carried on a gauge of 2 feet, and even passengers for short distances. But as tbe Denver aud Rio Grande Railway was to exceed 800 miles iu length, to traverse a variety of climates, to have a large passenger busiuess of tourist and health travel, as well as of emigrants and soldiers, and was required to carry many of the lighter and more bulky commodities, and cattle, it was admitted that the gauge should he just as much wider than the gauge of that existing narrow-gauge railroad, whose success, mechanically and financially, was indisputahle, as would permit these new conditions to be complied with.

For the government roads in India, a year's careful and tborough examination of the whole question hy a hoard of experienced commissioners had resulted in a majority of the board voting for a gauge of two feet uine inches, and the remainder for three feet six inches, which the goverument settled by adopting as a compromise the French metre, ahout three feot three inches, for a system of 10,000 miles decided upon for that country. But the roads of India were not to pass through or near a mountain country generally, and a large amount of cotton was to be carried, so that it might he considered advisahle to have a larger car-floor surface than under ordinary circumstances in the United States. Mr. Spooner's experience had suggested two feet nine inches for average conditions in England, while admitting that this might be too narrow for different characters of climates, customs, and prevailiug load. Mr. Fairlie recommended three feet. Norway and the Canada roads had adopted three feet six inches.

The hope, which has since been fully realized, of iuducing throughout the United States an uniform adoption by all narrow-gauge enterprises of the gauge selected hy this company, so that there might he no war of narrow-gauges, also entered into the queetion. It was not thought advisahle to abandon the American style of passeuger car, and upon this plan a three-feet gauge would permit three passengers to eit comfortahly across the width of the car, leaving sufficient space for the passage-way. Lees than this gauge would compel a reduction to two passengers, or the adoption of the English compartment system. A wider gauge would not admit of four, without making it too wide for economy, and besides it was every-day experience that by redncing the proportion of those passengers who conld have seats hy the windows, or hy themselves, it was made more difficult to fill all the seats. On the average, as we have eeen, even three seats are not occupied on wide-gauge roads.

As a resultant of all these varioue elements, the gauge of 3 feet was considered to best eatisfy the largest nnmber of the most important requirements and was adopted. The strong desire of setting an example whicb all the narrow-gauge railroads to he huilt in the United States would find it to their interest to follow, whether iu the East or West, sacrificing as little as possible in the extreme cases of location on the smoothest plains and in the most difficult mountains, aud meeting hest the average couditions of the topography and transportation husiness of the country, had a very considerahle weight in influencing the decision, and it is with great satisfactiou that we are able to anuouuce the thorough success of the new tentative gauge iu this respect. It has commended itself to the judgment of all narrow-gauge engineers, and without exception, so far as known, every narrow-gauge project in the United States has adopted the same width. There will he no war of narrow-gauges. The Uuion Pacific Railroad Company has, during the year, constructed the Colorado Central Railroad west from Denver of the same gauge, —3 feet—on which the cars of the Denver and Rio Grande Railway will pass without transshipment.

That the gauge of 4 feet 8½ inches, which George Stephenson found prevailing in the case of the roade and wagons in the north of England to which he first applied locomotives, should necessarily he the hest all over the world, for a new class of railways, and carriages of a highly improved character, would be indeed singular. While it might have heen suitable for horse-power, aud for an imperfect surface, it would surely have heeu extraordinary had this same width heen the most advantageous for an entirely new machine—the steam railroad; and even had it hcen best for a small, densely, and nniformly populated island of smooth topography, it would not have followed that it was the proper gauge for a vast continent of great variety in the charactor of its surface, population, and development.

In fact it *was* contested from the beginning, —not, however, on the ground of heing too wide, but too narrow. An able engineer, Brunel, claimed that 7 feet was a better gauge for England, and in the support of that claim urged, it is safe to say, with one exception, (that of its beiug a change from the existing order of things,) every argument that has been adduced in latter days to support this in hehalf of the 4 feet 8½ inches gauge as against one still narrower.

Thus it happened that for 30 or more years, during which the war of the wide gauges has heen going on, attention has heen drawn away from the true direction for inquiry, to wit, whether the narrower of the two broad gauges wae not too wide for true economy, and therefore for the greatest efficiency. Two competitive wide systems grew up alongside of each other in England, and to a less extent, thanks to our comparative poverty, in the United States. The results of that long struggle are well known. Now, the narrower of the broad gauges is being seriously challenged in every country; while in the United States, where three feet has heen adopted by the uniform judgment of narrow-gauge engineers, a large number of roads have organized, many of which are under construction and in operation, for sections varying from 12 to 156 miles each. Thus it will he seen that the one admitted deficiency of narrow-guage roads—that they are different from the existing ones, aud prevent interchange of cars for through husiness—is ahout to be removed; that a narrow-gauge system is rapidly growing up, with the latest improvements in rolling stock, which will afford all the benefits of this interchange without many of the disadvautages which accompany it on the old roads. We have explained the reasons which induce the company to adopt the guage of three feet, and show how it has operated on the road thus far, but have refrained from polemical discussion, holding in wholesome veneration the thirty years' war hetween Stephenson and Brunel, with their followers, and will here leave the subject until still further actual experience has enabled us to stato something new.

About Quicksilver Extraction.

Eds: Press:—In your issue of August 23d, you allude to a previous article in your valuable paper of June 14th, from Mr. Kustel, all referring to the reduction of ciuuahar.

With your permission, I propose to tell you some things *I know* about furnaces and the redndction of cinnabar. And I will also take a "California standpoint," which is the point that will in this case lead near where the "truth lies buried." That we have yet much to learn in the reduction of metals, and particularly in the reduction of mercury from its ores, there is no one will deny; but that we have reached a point of progress, far in advance of your ideas as expressed in your issue referred to, I think can be demonstrated. In this article I propose to confine myself to reductiou of cinnahar by the Knox & Osborn furnace, which I know can be relied on, to do all I claim for it, and if it is better than has heen done by older processes, something has been gained for truth and progress. In working ore in large quantities, it is impossible to get exact assay of the whole, for however fair one may be in selecting, he may get ore that will be either above or helow the true average; and suppose a true average was obtained, I have never yet found two aseayers who gave the same result from a blow pipe, or other assay of a few grains; hence I am led to question the correctness of such assays, while hy a retort and fire assay, you take one to five pounds of ore, and if carefully done, you will come at a result near the truth, and be able to show no loss of mercurial vapor, or free mercury, and by an examination of the earth, non-metalic remains in the retort, it can be seen whether the rednction is complete, and if so you will have a closer approximation to the true quantity of metal than hy any other process. And by the same process, I propose to ehow that when this furnace is properly manipulated, there ie no loss of mercury, except at *one point* of which I will speak hereafter,

I will not go into any description of the furnace, as that is not the object of this communication, but will give enough of the proceess to explain the principle on which it works. The ore is put in at the top of the stack, aud, passing down, is drawn out after roasting at the bottom—the fire heing in the passage of the ore downwards drawn across the ore hy the aid of a snction-fan, which suction ie strong enough to prevent the vapors of mercury from penetrating the walls of the furnace, as long as the suction-draft ie continued. Nor can any vapors escape at the charging-pot on top; and should there be any unknown defect in the furnace, the air aud outside gases will penetrate the furuace, but no gases from within the furnace can possibly reach the outside and escape; and the same is true of the condensers. This fact will be patent to any one who will examine this furnace when in operation. Now, the question of the furnace-structure aboerhing the mercury is in part answered ahove, hut I will further say it is physically impossible for any vapors of the furnace to penetrate the masonry while the vapor-channel to the snction-fan ie kept open, and in working it is *never* shut. Nor is this mere theory only, for the masonry of two of these furnaces has heen thoroughly examined wbile undergoing repairs —one, without showing a trace of mercury in the *debris*, while the other showed just a trace, and on an examination of the material from which this furnace was built, it showed the same trace of mercury as the *debris* from the furnace.

The old furnacee of the New Almaden Q. Co., from the foundatione of which so much mercury was waehed, were very different structures from those in use there at the present time, and were very defective as compared with those now in use, which were supposed to remedy tbe leake of tbe old ones, bnt the main waste of these Almaden-furnaces (if there ie waste) will he found under the condensers, for while the furnace is hot enough to expel the vapors of mercury from the ore it will go out of furnace even if there is no suction to draw them out, nor is the relation in the construction and operation of the Almaden furnace and the Know & Osborn furnace so similar that hecause one was known to be defective, it would follow as a sequence that the other must he. In the K. & O. furnace the ore remains in the passage down 72 to 76 hours, at least 60 hours of what at a red heat, which is long enough to extract the last of the mercurial vapors from the ore, and a perfect redncticn cannot be effectod in much less time.

That we get such a reduction an examination of the debris from the "draw" will at all times determine, while to the educated eye of the operative who draws out the *Debris*, the sight of it as it comes from the body of the furnace red hot, is sufficient.

No metal can he lost here except by the neglect of operatives who havo it in charge. This brings us to the outlet of the vapor channel where the condensers are attached, which channel is underlayed with a heavy cast iron plate covered with brick and concrete through which (the iron) it is impossible for vapors or condeused metals to penetrate. From tbis chamber we pass to the iron condeusers, which are air and vapor-tight except at the door for clcaning out where some air constantly goes in, hut no vapor gets out. Even if the door of the condeuser is taken quite away, no vapor comes out. The metal from the condensers as it runs out is received in a wooden trough leading to the receiving pot or reservoir, also of iron. Through these coudensere, trough and reservoir nothing escapee us. And the number of condensers is only regulated hy the number that can be made to pay. We get some mercury in the last condenser we use and eome heyond in the long flue and at the coke chimuey, the final trap we eet for arresting the metal. We helieve the amount of metal escaping by the coke chimney to be very small, and not sufficient to justify the extension of the line of condensers, as the last condenser retains very little, the hulk being found in in the fourth to the eighth of our sixteen condensers. Our wooden flue (of any desired length), is made so tight that the vapors seldom show themselves, conducting the vapors to the coke chimney which is kept wet hy a continual stream of water, and as the vapors come from it, I have stood hy it in the vapors without any ill effects from the mercury, which it would have heen impossible to do if much mercury was present.

That there is some mercnry escaping here, I have no doubt; hut because we catch considerahle mercury at the coke chimney yon argue that we must lose some large unknown amount, the point of which argument we do not perceive, nor do I admit. The amount is large, but think, one-half of one per cent. of what is saved hy the machinery for saving the metal will cover this loss. And of this I am so well satisfied that I will make you a husiness proposition, which I also extend to Mr. Kustel, that I will give you an opportunity to test the vapors that pass the coke chimney, and for all the mercury you extract from them over and ahove one per cent. of the amount saved hy the varions means of condeneatiou employed, will hind myself to pay you ten dollars for each and every pound. Now if you think I am only "gasing" go in and mako some money, while you show the community where the quicksilver goes to, and why there is such a scarcity in the market. The furnace at our own mine (the firet of the kind huilt) has never had a coke chinney to save the "$50 worth" of mercury, saved at the Phenix, per month, and this furnace having run five years and at the same rate of loss as reported saved at the Phenix, there must be $3,000 lying ahout there loose, and we will give you the privilege of securing all of it, and will furnish you the flasks to put it in without charge.

Thie is a paying opportunity for you to upset "the imagiuary 99 per cent." theory, and thue advance tbe cause of true ecience, and prevent your readers from being "humbugged" by meu who are preeumed not to know what they are talking about. Now, ae I have already said, there ie yet much to learn ahout this business, and I feel confident no man will ever learn much of any practical valne without going to the field and into the husiness of reduction on a working hasis, and experiment it out as I have. You can thus not only test your own ideas, hut will have ample opportunity to "prove all thinge and hold faet that wbich is good." Having this practical part in view I invite you to visit us and see the working of this furnace aud explode tbis 99 per cent. husiness on your return.

R. F. Knox.

Jute is principally manufactured at Dundee, Scotland, where there are 50 mills ranging from four to eight stories high. The largest mill employs 5,000 hande, and works up into fabrics 1,000,000 pounds of raw jute per week. The principal consumers of burlaps or jute cloth in the United States, are Californians, who use them for grain bage. Ten per cent. of the value of the California wheat crop is expended in the purcbase of coarse jute cotton and linen bags.

A thousand hoxes of "extra fine new season's Moyune gun-powder green tea, ex-Sarpedon steamship from Cantou," sold two weeks since, in the Euglish metropolis, contained forty to forty-three per cent. of iron filinge and nineteen per cent. of silica, in tbe form of fiue sand, cleverly mixed with and added to the leaves before curing.

Lithographic Stone. — Apprehension has been felt as to the future supply of this necessary substance, as the German quarriee, from which are taken nearly all the lithographic stone used, are becoming exhausted. New beds have, however, been recently discovered in Italy, near the French frontier, and on tbe coast of the Gulf of Genoa.

Fooled.—An Indiana man claims to have succeeded in playing a thorough confidence game upon the potato hugs. He planted a grain of corn in each potato hill, and as the corn came up first, the hugs thought it was a cornfield and started for other scenes.

The result of soundings made in the Atlantic Ocean seems to indicate that the average depth of its hed is not over 12,000 feet, and in few places is it deeper than 15,000 or 20,000 feet—in other words, ahout the hight of Mont Blanc.

THE CHARGE FOR WATER is higher than that for gas in San Francisco; but as the majority of the inhabitants do use gas occasionally, there is much more complaint made of the latter tax.—*Gaslight Journal.*

A PRETTY SPEECH.—The following pretty speech was recently made by a bridegroom:

To-day I shake hands with the past. I live henceforth in future joys. An unknown door is opened, and I enter an abode of beatitude. I am confident of the future. The shadow of the present shall fall upon it even when my bride and I have grown old, and invest it with sunset glories. I may not deserve the good I have won. It gives itself, and if not given, no wealth, genius, beauty, or wit, no gold of earth or gem of heaven is rich enough to purchase it. Loving thee, my bride, my heart shall keep its old memories like the sea-shell its wonted melody. Love's music steals on us like dawning light, which all over the heavens spreads and invests the world with beauty and glory. The road that led on through the unknown future was dark and dreary; but celestial splendor now lights up the gloom; and the fair bride, her spirit-self, a Peri at the gates of Paradise, invites me onward and upward to a life of purest pleasure and duties of beneficence.

THAT FAVORITE HOME REMEDY,

PAIN-KILLER,

Has been before the public over THIRTY YEARS, and probably has a wider and better reputation than any other proprietary medicine of the present day. At this period there are but few unacquainted with the merits of the PAIN-KILLER; but, while some extol it as a liniment, they know but little of its power in easing pain when taken internally; while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all, that it is equally successful, whether used internally or externally. It is sufficient evidence of its virtues as a standard medicine to know that it is now used in all parts of the world, and that its sale is constantly increasing. No curative agent has had such a widespread sale or given such universal satisfaction.

DAVIS' PAIN-KILLER is a purely vegetable combound, prepared from the best and purest materials, and with a care that insures the most perfect uniformity in the medicine; and while it is a most effective remedy for pain, it is a perfectly safe medicine, even in the most unskillful hands.

It is eminently a FAMILY MEDICINE; and by being kept ready for immediate resort, will save many an hour of suffering, and many a dollar in time and doctor's bills.

After over thirty years trial, it is still receiving the most unqualified testimonials to its virtues, from persons of the highest character and responsibility. Eminent Physicians commend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, etc., but for Dysentery, or Cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India, and other hot climates, it has become the standard medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and all other kindred disorders, For Coughs and Colds, Canker, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine.

We would caution the public against all imitations of our preparation, either in name or style of putting up.

The English Wheat Supply.

With regard to comparative production and importation of bread-stuffs in England, the London *Daily Telegraph* of August 11th, says: The average consumption of wheat per head has been found to be—taking man, woman and child together—about a quarter to each individual. A quarter is two sacks or eight bushels, and the amount produced in the United Kingdom may be set down at the average of fifteen million quarters. The average produce to the acre is about thirty bushels, or three quarters and six-eighths of a quarter, and hence it will be seen that if we get seventeen million quarters this season—which is quite likely—there is less bread-stuff to purchase abroad by as much as two million mouths consume. But these rough figures will also show how very largely we must continue to depend upon foreign harvests. To put the matter clearly, a good half of the population of Great Britain is fed now with flour grown abroad, aud could not be fed otherwise. As much as a seventh, perhaps, of the yield of wheat goes back into the land in the shape of seed; so that the number of mouths filled with home-grown bread cannot safely be called a moiety of the population. On the other hand, the processes of agriculture are yearly improving, and more grain is obtained to the acre than formerly. We shall not be far wrong in saying that a good harveet means now-a-days the feeding of half the people with British-grown bread; and a bad harvest, the having to send abroad for at least two-thirds of the wheat and flour which our thirty-two millions of mouths consume.

A PULU PLANT.—One of those singular vegetable productions, with the product of which Californiane have become so familiar, as a substitute for hair in mattresses, may be seen growing in the window of Dr. L. Lanszeweert's drug store, near the corner of Fourth and Harrison streets, in this city. This is one of two plants that were recently brought from the Sandwich Islands by Mr. Wm. R. Frinks. The other was taken to Woodward'e Gardens, but we believe, has not yet ehown any signs of growth. A specimen of this plant wae sent to the Academy of Sciences of this city a few years since, but it never showed any growth, and we believe Dr. Lanszeweert is the first who has succeeded in this effort.

HIPPOPHAGY IN FRANCE.—According to *Le Monde*, there are now as many as forty shops or stalls, in the city of Paris alone, devoted to the sale of horse meat as an article of food; and during 1872 there were, in round numhers, 10,000 horses, 900 asses, and 50 mules consumed by the inhabitants. The animals are prepared for the market in the usual way, and the meat sells for about half the price which is commonly asked for beef. The horses are in all cases subjected to careful examination by official inspectors. It is also stated as an interesting fact that, so far from hippophagy declining, it ie decidely on the increase, the figurcs showing that nearly two and a half million pounds of equine meat were sold in 1872, as against half that quantity in 1860.

THE COINAGE at the San Francisco mint for the month of August was unusually large, reaching the sum of $2,131,000, of which $110,000 was in trade dollars. The work of adjusting each trade dollar is equal to the work on a $20 piece, the adjustment heing as fine as on the more valuable coine, and therefore the work is equal to the coinage of $4,221,000, in $20 pieces.

THE ENGLISH SPARROW.—There is much talk of introducing the English Sparrow into this city, but opinions conflict as to whether the step would be beneficial or otherwise iu its results. Although it eats the grubs and worms which infest vegetation, it is said to prefer wheat and oats to the parasites, for which reason the birdis regarded by English farmers as a pest. Other people aver that it is a useful check upon insect life uoxious to vegetation.

CALIFORNIA TOBACCO, raised near Gilroy and cured by the Culp process, is spoken of as excellent in quality. Laborers are now cutting and curing the crop of Florida Tobacco in a field west of Gilroy. The *Advocate* states that the officers of the company are confident that they will sell their cigars at good figures as fast as they cau manufacture them. The enterprise has now passed its experimental stage and its success is a fixed fact.

THE *Resources of California* for August contains a vast fund of information concerning our State, prominent among which is a detailed description of "Southwestern California" by Prof. Knowlton. The article referred to is lengthy but readable, and gives a very good idea of the country spoken of. The selected matter in this issue of the paper has been judiciously collected, and all pertains to the welfair and progress of different parts of the State.

San Francisco Metal Market.

WEDNESDAY, Sept. 3, 1873.

The Metal market continues quist, with no changes to note since our last Review. There has been somo inquiry for Nails, which have been selling at $5.75@$8 keg for the various sizes.

Leather Market Report.

[Reported for the PRESS by Dolliver & Bro.]

Prices of Leather of different kinds do not ohange. The month has opened more favorably to dealers, though we have only had two days' indications on which to form an estimate. The usual Fall changs has set in, and mors frequent inquiion is noticed, with prospects of improvemsk. As we have before stated, the tendency for the last month has been for the better, but the sales, while frequent enough to keep the market tolerably firm, do not seem as yet to have influenced rates to any great extent.

Eastern Wax Leather	—@—

GENERAL MERCHANDISE.

Bags and Bagging do not recover from the downward tendency begun some time since. The Oil trade is also quite weak, with little doing. The Demand for Cured Meats is strong, and Provisions generally are firm.

Office, Room No. 22, Merchants' Exchange Building, California street, San Francisco, Cal. au6

Washington Mining Company—Principal

place of business, San Francisco, State of California. Location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 11th day of August, 1873, an assessment of two dollars per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company in San Francisco.

Any stock upon which this assessment shall remain unpaid on the 16th day of September, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the 10th day of October, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.

To Capitalists and Hydraulic Miners.

PATENT SELF-CLEANING SLUICE.

This new and useful invention is designed to collect all the gold as fast as it is set free from the dissolving earth, and conduct it into a receptacle of mercury or safety pocket, under lock and key, from whence it may be removed in a few moments, without either checking the flow of water or interfering in the least with the washing.

The invention, if properly placed in our rivers, will also collect the gold which is yearly traveling down their channels, thus affording an annual income with a trifling expense for attending.

For further particulars address

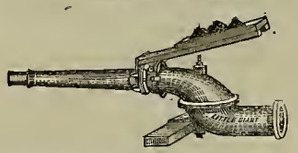
Machinery.

TO HYDRAULIC MINERS.



I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A.....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

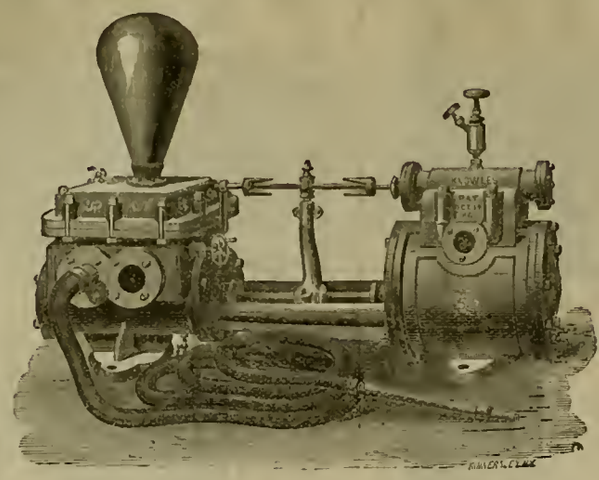
KNOWLES' PATENT STEAM PUMP.



☞ It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, Cal., January 14, 1873.

A. L. FISH, Esq., Agent of the Knowles Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

U. S. NAVY YARD, NEW YORK, June 3, 1871.

MESSRS. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully, WM. W. W. WOOD.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a FIRST PREMIUM and Diploma, awarded to the Knowles Patent Steam Pump, as published in the Official List September 23d, 1871.

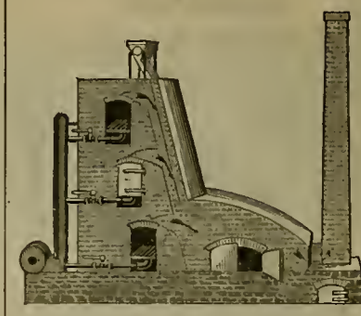
EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the best can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

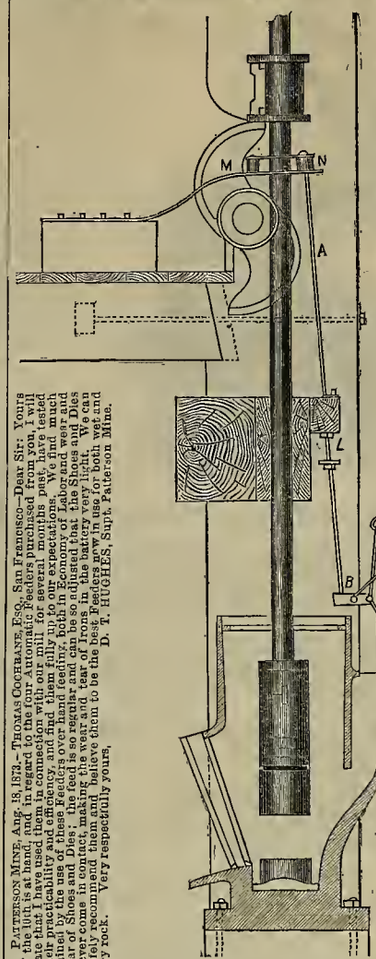
COCHRANE'S ORE FEEDER FOR QUARTZ MILLS



Patterson Mine, Aug. 18, 1873. Thomas Cochrane, Esq., San Francisco—Dear Sir: Yours of the 16th is at hand, and in regard to the four automatic Feeders you put in my mill for several months past, have tested their practicability and efficiency, and find them fully up to our expectations. We find much state that I have used them in connection with our mill for several months past, have tested saved in the item of labor, and the wear and tear of Irons in the battery. The Feeders never come in contact, making the wear and tear of Irons in the battery less than when fed by hand. We safely recommend them and believe them to be the best Feeders now in use for both wet and dry rock. Very respectfully yours,

D. T. HUGHES, Sup't Patterson Mine.

Office of the Board of City Hall Commissioners, corner of Leavenworth and McAllister streets, San Francisco, July 19, 1873.

SEALED PROPOSALS, For Furnishing certain material for a portion of the New City Hall Building and Hall of Records, will be received at the office of the Board, until 12 o'clock, noon, of WEDNESDAY, the 1st day of October, A. D. 1873, for the following:

ROLLED IRON JOISTS.
WROUGHT IRON GIRDERS,

All according to Specifications, Schedule, Plans and Drawings, to be furnished by the Board.

No Bid will be entertained unless made on the "Printed Forms of Proposal," and accompanied by a bond with two good and sufficient sureties, in a sum equal to 10 per cent. of the total sum of the tender, conditioned for the due entering into the contract of the party to whom it may be awarded.

The Bids must be endorsed for the Material proposed to be furnished, and addressed to the Secretary of the Board.

The Specifications, Schedule, Plans and Drawings can be seen, and all further information obtained at the office of the Board, where also Forms of Proposal will be furnished to intending bidders.

The Board reserves the right to reject any or all bids.

Payments will be made monthly, in "City Hall Warrants, of 15 per cent. of the estimated amounts due, and the remaining 25 per cent. when the contract is completed.

The expense of advertising will be charged pro rata to the successful bidders.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,
Board of City Hall Commissioners.

PROPOSALS

To Construct Alterations and Improvements to Hospital Buildings and Grounds.

Clerk's Office, Board of Supervisors,
San Francisco, Sept. 2d, 1873.

In accordance with Resolution No. 4368 (New Series), of the Board of Supervisors, sealed proposals will be received in open session of the Board on Monday evening, September 8th, 1873, from 7½ to 8 o'clock, to furnish materials and construct alterations and improvements to the City and County Hospital Buildings and Grounds in the block of land bounded by Potrero Avenue, Nebraska, Nevada and Sierra streets, in strict accordance with the plans and specifications.

The work to be done in a good and workmanlike manner, and to be completed in all respects to the satisfaction of the Committee on Public Buildings, under the superintendence and supervision of a Superintendent appointed by the said Committee, and of Mr. S. H. Williams, Architect, Room 61, Merchants' Exchange Building, where the plans and specifications are now open for inspection.

Notice.—Bidders will state a specific sum for which the entire work will be completed in accordance with said plans and specifications, with the understanding that no bid will be entertained from any person who is not recognized and known as a Builder. A good and sufficient bond to the full amount of the contract price, if awarded, will be required for the faithful performance of the contract.

In order to preserve uniformity and to facilitate the award, the Board have resolved to receive no bids unless made upon blank forms prepared by the Committee, and a certified check for the sum of One Thousand Dollars, deposited by the bidder with, and made payable to the Clerk of the Board, conditioned if the proposal is accepted and the contract awarded; and if the bidder shall fail or neglect to execute a written agreement and give the bond required within six days after the award is made, then, and in that case, the said sum shall be paid into the City and County Treasury, by said Clerk, as liquidated damages for such failure and neglect.

Blanks furnished by the Clerk.

The Board reserves the right to reject any or all bids, as the public good may require.

JNO. A. RUSSELL, Clerk.

MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Prices.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found **more economical, advantageous and reliable** than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

Eureka, Nevada, July 10, 1872.

T. M. Martin My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. O. GOODWIN.

Emma Hill Consolidated Mining Co.,
Little Cottonwood, Utah,
Superintendent's Office, Sept. 28, 1872.

T. M. Martin, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a cure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no water or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, San Francisco.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

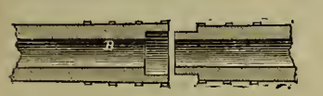
VOLUME XXVII. Number 11.

Wooden Water Pipes.

We preecnt thie week illnstrations of the wooden pipe which the Waehington Water and Gas Pipe Company have been manufaotnring for several years, at Olympia, Washington Territory, nnder the Wiekoff patent. Fignre *A* gives a view of the oxterior of the fioished pipe. Figure *B* is a sectional drawing, showing the mode of connection.

In selecting the wood nsed in making the piping the greatest care is exercised. The red fir of Puget Sound hae been employed, as it is one of tho moet lasting kinds of timber known. In testing different timbers of the Paeific Coast at Mare Island, the Government officers prononnced this red fir to be superior to oak in point of dnrability. Again, it is a matter of great importance to take only the body of the tree, helow the limbs, and to remove all sap wood. Logs thns eelected, and cut at the proper eeason of the year, are eawed into lengths of eight feet, and bored with the Wickoff augur, which leaves the core intact. Thie core is in tnru hored for a emaller pipe, and its core for a etill emaller, if the size of the original log admits, thns ntilizing timber which woold be loet if treated in the ordinary way—an economy of labor ae well ae of material.



When hored, the log is dressed in a lathe to a frustrum of elight inclination, to allow wronght iron hoope to be driven tightly on, ae seen in the cut, when the pipe ie required to stand a greater pressnre than the wood alone will resist, the number of these bande being proportioned to the head of water from which the pipe is snpplied. Thne the necessary strength can be calculated and the bands adjnsted to a nicety. Before heing banded, or as a finishing procese, when handing ie not needed, the pipe is thoroughly seasoned in a steam chamber, and finally coated with asphaltum. This protects the outside, while the inner eurface is left hare, it heing a well known fact that wood constantly in presence of water will not decay. It is the variation from wet to dry and back again that corrodes the fibre. It is claimed that hy this treatment the wood is actnally rendered more lasting than iron. In caee mineral or saline water he present in the soil, timber would certainly have the advantage over iron. Iron pipee in presence of waters impregnated with corrosive ealts, rapidly rust and hecome closed up. This difficulty is a great annoyance in Bostou, where nnprotected four inch pipe became clogged in seven years.

Among the advantages of wooden pipes are the ease and rapidity with which they may be laid, from the simplicity of the joint, as indicated in onr cut; facility for tapping, an auger being the only tool necessary; and, most eesential of all, cheapness. In regard to this latter point, the company'e agent in this city has been instructed to eell at one-half the price per lineal foot of iron pipe of equal hore, for the present. We may add that the plan ie far from being an experimental one. Elmira and other towne in Westeru New York have long been eupplied with pipes made in the manner described, which have proved entirely satisfactory in every respect. Wood wae nsed for piping centuries ago; it is the peculiarity of construction, and tho nse of the wonderful Wickoff auger, that are the dietinctive featnree of the Washington Company's product. Teets made in thie city, Anguet 23d, were deemed eo eatiefactory hy the officers of the Spring Valley Water Company that they have agreed to permit the wooden pipe to be ueed in eonnection with their mains, a fact in itself a snfficient endorsement.

Our Beet Sugar Interest.

The *Bulletin* saye our "beet sugar interest is not in a very flattering condition at present," owing to the low price of cane sugar; the removal of the import duty on certain deecriptions of eugar; the high price of fnel, ete. The drawbacke meutioned are no doubt eomewhat discouraging to the sugar interest generally; hut not more so to beet than to cane sugar; for the factory at Sacramento has fully demonetrated the fact that beet eugar can be made in this State cheaper than cane sngar—in fact that it would continne to be a success, even if all deecriptions of raw sugar were to be admitted duty free.

Indeed, we understand that one of the largest refining companies in this city hae become eo well convinced of this fact that it has already purchased a large quantity of land, on which it proposes, at an early day, to commence raising the sugar heet, with the view of changing the entire establishment from a cane eugar refinery to a heet sugar mannfactory and refinery. We have faith to helieve that the time is not far distant when the eugar product of California will equal in value that of her wheat product.

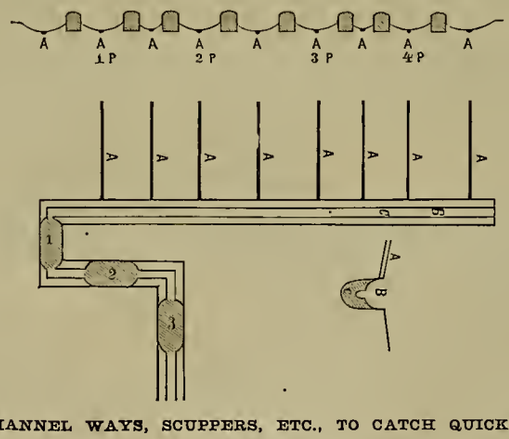
The New Mines on Trout Creek, Montana, are creating great excitement. Trout Creek ie a stream emptying into the Missoula River, four miles ahove the month of Cedar Creek. The miners who fonnd the diggings turned up a nugget of $7.50, and are eaid to he taking ont dirt averaging 25 cents to the pan. The discovery was made about twelve milee above the mouth of the Creek. Mining is also heing done on several of the tribntaries of the Trout, all of which put in above the new discovery. The local papere think the uew digginge will beat the campe on Cedar Creek—the last stampede.

The discovery ie reported of an immense copper lodge in the southern part of Utah Territory. It is eaid to crop out 3,000 feeet in length.

Suggestion to Millmen.

The accidental loss of qnicksilver nnder pans and eettlere and the wastage of the eame are well-known facts. "Valverde," onr San Dimae, Mexico, correspondent, writee us that to remedy this in his mill he built channels nnder the pans and settlere, of mortar, and polished them smooth—four parallel roade, eo to speak, one under each pan and between the timbers, with a curvature of five inches. These are united in one common channel (much deeper, of course), and containing several hasins ("piletas"), so that any qnicksilver which escapee from the pansor settlere falls into the ehannele, and hy reaeon of the fall rune into the large channel where it ie canght in the "piletas."

The accompanying cut shows the very simple plan described. *A A A*, etc., are the guttere of channels rnnning into the deep channel *B;* 1, 2, 3 are "piletas" or recesees to catch the qnicksilver, and are twelve inchee deep. The pan timbere shown are rounded off on top to ehed water or quickeilver, with chsnnel ways to run the eame to the large chaunel,



CHANNEL WAYS, SCUPPERS, ETC., TO CATCH QUICKSILVER.

made of lime, and polished off emooth; one inch fall to two feet; 1 *P*, 2 *P*, etc., show the location of 1st pan, 2d pan, etc. The emall cut to the right is a cross section in which *A* is the gutter, *B* the deep chanuel and *C* the "pileta" or scupper; *c* is the gutter of *B*. "Valverde" saye that he started up the mill in March and on the fourth run a settler burst with 2,000 pounds of qnicksilver, a large part of which would have escaped but for the precautious adopted. The loss hy weight was seven pounds and that splashed over the sides, which he hae since extended. The mine helonge to the Durango Mining Co., of New York. The first rnn was 100 tons of $85 rock—represeuting 86 per cent. of the assay. They are now rnnning on $140 ore and 100 tons or more of $250 rock.

Extensive placer mines are reported as have ing heen found in northeastern Arizona, and are said to extend over a district 40 milee equare. The country ie well timhered and watered. Bodies of anthracite coal have also heen diecovered. The prospectors will shortly return to thie city, when we will probably learn more of the eection referred to.

Cinnabar ore hae heen found on land belonging to Mre. Clark, ahout five miles from Benicia on the road to Suisun in Solano county.

Mine Swindles in Utah.

The operations of unscrupnlous epecnlators in mining property, in Utah, are doing, and have done, more harm to the mining interests of the Coast than can well he computed in dollare and cente. We have had the odinm of a good many ewindling traneactione in thie State and Nevada, hnt Utah bears off the palm. Not that the men there are more diehonest than elsewhere, bnt a clase of people seem to have gone to the Territory for the exprees pnrpose of putting up jobs on unsnspecting individnals. We have had onr eye-teeth ent, further weet, hut Utah ie eo much nearer the great centers of capital than we, that it is a glorions field for the clase of men to whom we refer. The nndoubted richness of some of the mines in that Territory has attracted the attention of capitaliste everywhere and the conseqnence is that, for eome time, investments in Utah mining property were heavy. The mines there need capital to develop them like those of all mining conntriee, and they were eo successfnl in getting it in many instancee, that unfair meane were employed hy nnscrupulons men to indnce inveetment.

The real reeidente of the Territory, who have ite interests at heart, no douht, deplore the existence of theee facts more than any one, except thoee who loee their money; hnt still there is a class of nomadic epecnlatore roaming ronnd Salt Lake, who have no means to live on bnt their wits, who strive in every way to get the beet of any one they can. What better field could there he for thie class of people than in a new and rapidly developing mining conntry, within eaey reach of railroads, and where capital wonld be likely to come. They make intangible locations, lay ont imaginary mill-sites, hnild mille and furnaces on paper, and wagonroads the same way, and with these and a few stolen specimens of ore, ae a etock in trade, begin their nefarione businese. Very few people from the East know anything about mince, and theee ecampe are very glad they do not. They fix np some planeible etory to get their money, aud then walk off with their epoile.

Hardly a week passes that we do not hear of some sharp operation in mines, either great or small. The lateet news of thie kind is, that a euit has been institnted for $50,000, in which the plaintiff alleges that he was induced by gross mierepreeentatione to buy 300 feet of the Left Bower lode in Tintic, for which he paid $30,000. Defendants are alleged to have ehown ore which they eaid had heen taken from the said lode, and assaying from $250 to $2,000 per ton. Plaintiff allegee that in fact there was no vein as represeuted; that no ore had been taken from the Left Bower, and that the lode was and is entirely worthless.

This is an old story in terse legal phrase. We do not know anything about thie partienlar case, hnt there are many similar onee which we remember. The strangest part of all this is, that none of the ewindlere are ever published.

They all get off one way or another. If the courte had as little mercy on them as minere' committeee have on jnmpers and horse thieves, the community would be better off and the mining intereste more prosperone. The fewer of these harpiee there are in a distriot the faeter that district will he developed. They never do an honeet day's work, bnt loaf aronnd seeking whom they may devour, and bring the whole businees of mining into discredit. We hope Utah will have luck enongh to get rid of some of them in a manner which will set a wholeeome example to the others.

CORRESPONDENCE.

Notes of Travel in Lincoln County, Nevada.

[By Our Traveling Correspondent.]

Silver Peak S. M. Co.

This is also an incorporation, with its principal office in San Francisco, and working under the laws of the State of California. Mr. John Nelson is Superintendent of this company. The mine and works are located about 1½ miles east of the town of Pioche. The mine is bounded by the Vulcan on the west and the Mocking Bird on the east. The formation of the country rock in this mine is quartzite on both eides, and ehows a true fissure vein, running east and west, and pitching south at an angle of 60°. They are developing the mine by an incline ehaft following the dip of the ore body, which is eunk to a depth of 215 feet. Over thie ehaft ie erected fine hoisting worke, completed July 27th, thie year. Although they only cost $8,771.29, including coet of machinery, transportation, timber and cost of putting up, they will be able to develop this mine from 800 to 1,000 feet with an engine of 35 horsepower. Milbng ore wae first struck in this mine at a depth of 160 feet; at this point a stope is opened to the weet, and at a depth of 210 feet a stope is opened to the eaet and one to the west. In these stopee the ore body ehows from 24 to 48 inches thick; fthe ledge between the walls is from 4 to 6 ft. thick. There are about 100 tons of ore upon thie company's dump that, it is eetimated, will mill $70 per ton. 60 tons of ore, worked in May last from this mine, at the Meadow Valley mills, netted $3,956. Only 18 men are employed at this mine.

Havana Mine.

Located east of, and next adjoining the American Flag mine. This is an original location, dating back to Oct. 14th, 1869, and contains 1,200 feet in the claim, running east and west, and like nearly all other locatione in thie district, dipe to to the south, but probably a little more vertically than any other, at present about 80°. This mine is owned by John Wileon, John N. Craig, John C. Lynch, John Baker, John R. Clark, John R. Wilson, Wm. J. Kelly, and Cheeley & Jones of San Francisco. Tbe mine is being developed by an incline shaft following the ore body from the surface, the present depth of which is 260 feet, at which point—owing to the disadvantage of working by windlass to any greater depth—they commenced drifting on the ore body to tbe eastward about the 7th of August. Here an immenee ledge is exposed, that is 15 feet between the walls. The hanging wall is of quartzite, and the foot wall is a conglomeration of granite, porphyry, and quartzite. In thie east drift they are taking out about 4 feet wide of ore, following the foot wall; how much more of the whole ledge matter is ore, is as yet unknown. Along tbis foot wall, a fine clay gouge of 2 or 3 inches in thickness is found, causing the ore to be very easily extracted. They have now upon their dump about 50 tone of ore that will aesay on the average $200 per ton, and it is eafe to eay will mill $150 per ton. At preeent they are employing four men. There appears to be no waete whatever in tbis mine, but it ie all first-class ore.

Sumner Mine.

Thie location was recorded in May, 1872, and is owned by Meeere. M. Shuetrich, James Toland, Henry Segenaud, Louie Solomon and B. J. Ashim & Co. The company claim 1,400 feet of a ledge running east and west, dipping to the south at an angle of sbout 50°, and located on the most northerly spur of this district, and within 200 yards of the Star Reetaurant in the city of Pioche. The development upon this mine consists of an incline ehaft eunk on the dip of the ledge to a depth of 150 feet. At this point they have a ledge about three feet thick, between regular walls of quartzite and limestone, the latter forming the foot wall. About 20 inches of this ledge is ore of a low grade, assaying about $40 per ton. In the last 20 feet of sinking the ore has increased in value from $26 to $40 per ton. A contract to sink this ehaft 50 feet deeper has been let, at $8.50 per foot. Before that depth ie attained they will be able to know whether to erect hoisting works or not, for its further development. It looke as though it would develop into a valuable mine.

Meadow Valley Warm Springs.

L. H. Callaway, proprietor. Thie popular bathing resort of Eastern Nevada, is located about one mile north of Panaca, and 1¼ miles east of Bullionville. This spring looks more likes a small lake, from which about 400 inches of water flow, the analysis of which givee considerable iron, with traces of sulphur and eoda. It is soft water, which is contrary to all otber eprings in this section of Nevada. The waste of this epring serves to irrigate some 75 farms, and furnishes the water for all the mills at Bullionville, some 5 in number. The facilities for bathing at this epring are second to none on thie coaet, for both bath and plunge. My advice to every one passing this way is to give Mr. Callaway a call.

Bullionville and its Mills.

Bullionville ie located eome 12 miles nearly eouth of Pioche. Thie locality is almost entirely supported by the mills of the different mining companies operating at Pioche. This place contains about 400 inhabitants but usually when all tbe mills are in operation, there are at least 500. There are located at or near this place 5 mills, only 4 of which are in operation at this date (Aug 15th); one other, not above enumerated, known ae the Amador Tunnel Co's. mill, is located 3 miles dietant in the direction of Pioche. The

Raymond & Ely Co's Mills,

Two in number, one a 20-stamp and the other a 30-stamp mill, are euperintended by Mr. T. D. McMasters. They are each run by eteam, and have all the usual appurtenances for reducing oree that are used in and around mills of their capacity. They employ about 75 men, and reduce about 110 tons of ore every 24 hours. The ores are now brought from the mines at Pioche, to this place, by the Nevada Central R. R. (narrow gauge) and have been since some time in June last. The Chicago, or

American Flag Mill,

Is also located at this place. This mill is run by steam, contains 15 stamps, and has a capacity of reducing 25 tons every 24 hours. This mill is dry crushing, and is superintended by A. T. Moore, and is at present running on custom ore. It gives employment to eome 18 men.

Nevada Central Railway,

W. H. Raymond, President; H. C. Chapin, Secretary and Paymaster; Joseph W. Nesbitt, Superintendent. This road runs from Pioche to Bullionville. Length of line, 21 milee; gauge, 3 feet; maximum grades, 200 feet; curves, 15°. The road was built for the ore traffic,—to supply the mills at Bullionville,—and is now in euccessful operation, doing all the business that can be done with its present equipment, which will be increased in a short time. Both care and engines have been ordered from the manufacturere. The company has, in connection with the road, a foundry at Bullionville, where they are prepared to do all kinds of milling and mining work.

Bristol District

Is northwest from Pioche, and distant about 25 milee by the road, although on an air-line it is not over 18 milee, and located on the border of Nye County, Nevada, and five milee southeast of the town of National, Nye County. This mining district was first located in the latter part of 1870. There are some 75 locations taken up, all of which have had sufficient work done upon them to hold them, and three of that number are now working more or less men. The Hercules, the Ontario and the

Sultan Mine.

This latter location, the most prominent of the district, contains 1,000 feet, running in a nortb and south direction. The owners are W. H. Raymond, Lewia Sultan, H. Jacobs, Samuel McMasters and C. W. Roeden. The country rock of this district is limestone; it looks like decayed white marble. The oree are base, requiring to be smelted; and contain lead, galena, eilver, antimony and iron, in about the following proportions: 18 per cent. lead, from five to eight per cent. galena, from $80 to $120 per ton in silver, a large percentage of antimony and about three per cent. of iron.

The development on this mine consists of an incline shaft sunk on tbe dip of the ledge, which ie at an angle of 35° to a depth of 125 feet, at tbe bottom of which the ledge showe an average width of 18 feet.

They are working by windlase. In sinking this shaft to its preeent depth some 400 tone were extracted, and are now on their dump. The lowest estimate set upon the eilver value of each ton is $90. At preeent, working seven men. Thie district is well timbered (speaking in the language of a Nevadian), but water in quantity is not nearer than the town of National, five miles away. The minee look well for permanency, and improve with every foot of depth sunk upon them. The next mine of importance adjoining the Sultan is the

Hercules Mine.

J. C. Warren, of San Francisco, is President; I. T. Milliken, Secretary; and C. L. Roe, Superintendent. This corporation claims 3,800 feet of locations, comprising the Hercules, Wabaeh, Copper Glance and Bizano, or Cave Mine.

This mine is being developed by a tunnel run in on the ore body to the north, a distance of 250 feet. At a point in this tunnel, 125 feet from the mouth, they rose up, following the ore chimney on an angle of about 45° to within 50 feet of the eurface. At this point the ore body had a downward tendency, eo a vertical ehaft or winze was sunk to a depth of 25 feet, or back again to the level of tbe tunnel. The ores from this mine are of a fine emelting character, are quite soft, and contain a large percentage of yellow oxide of lead. Five hundred and twenty-five tons of ore from this mine worked at the National furnace, at the town of National, paid an average of $80 per ton in silver, beeides the lead, some 18 per cent. There are some 450 tons on their dumps tbat it ie estimated will go at least $100 per ton in silver. At present they are working 11 men.

Coal Mines.

As fuel is the next great important item to water in a mining district, it may not be uninteresting to your readers to know that one of the largest semi-bituminous coal beds is within 80 miles of Pioche. To more thoroughly describe the locality of this coal deposit, I will state that it ie in the Waeatch Range, within four miles of the town of Kanarah, Iron Co., Utah Territory, 80 miles nearly east of Pioche, and 300 miles nearly eouth of Salt Lake City. The Utah Southern Railroad will run within three miles of thie coal mining belt, when completed. These mines are the property of J. R. and Charlee Duff, of Pioche, Nevada.

There are four separate veins, varying from two to ten feet thick, that lie horizontally, or nearly so. Commencing at the lower strata of coal of two feet thick, it rests on a bed of shells (oyster, etc.,) and clay. Above this layer of coal is a stratum of eandstone and shells, six feet thick, then another layer of coal three feet thick, then, still above this, another layer of five feet in thickness of sandstone and shells. The third vein of coal comes next, three feet thick, then a thin deposit of about twelve inches in thickness follows, and above that a vein of coal ten feet thick. Two tunnels have been run in upon this coal deposit, at a distance of three-quarters of a mile from each other; one tunnel is in 50 feet and the other 150 feet. These tunnele are six by eeven feet in the clear. No drifting has been done, but the tunnels reveal a continuous body of coal all the way. Everything taken out is coal of first quality. Capitalists at Salt Lake City are now negotiating for an interest in the mines. About 15 miles west of this coal deposit, in another range of mountains, known as the Harmony Range, exists one of the finest and probably most extensive deposits of

Magnetic and Hematite Iron Ore

Known in the United States. There are five ledges taken up and owned by Duff Bros. These deposits are similar in character to gold and silver ore bodies, having regularly defined walls running northeast and southwest, and pitching to the northwest, and at an angle of about 85°. The croppings are from 10 to 30 feet wide on these ledgee. Three of the locations above mentioned are of hematite, of whicb Bessemer eteel is manufactured; the other two are magnetic iron ore. The country rock on botb sidee is granite. Sufficient work is being done on the mines to hold them, and a United States Patent has been applied for. Timber is found on the mountains eurrounding, and a fine spring of water running from thie iron deposit. Fluxes are also obtainable in any quantity on the grounds claimed.

L. P. Mo.

Little Cottonwood Mines.

EDITORS PRESS:—As the season of 1872 wae conspicuoue for the sale and transfer of mining property, thereby reaping to the proprietor and oftener to the speculator a rich harvest of greenbacks for a little toil, so the summer of 1873 has been a proeperous one to the inveetors and partiee developing the mines of this district. Little Cottonwood has certainly made a remarkable advance in the development of existing minee, and the diecovery of new ones: thie also during a year of almoet unprecedented dullnese in mining industry. It is suppoeed that most of the readers of the MINING AND SCIENTIFIC PRESS are aware of the situation of Little Cottonwood. But for the benefit of those who are not, I will state tbat the distance from Salt Lake City is 25 miles by wagon road and 28 by rail. The Wasatch and Jordan Valley Railroad connecting at Sandy station with the Utah Southern Railroad for Salt Lake and all points eaet and weet, tbe narrow-gauge road is finished to a point within six miles of Alta City, and is expected to be completed to thie place by the fall of the present year, though this is somewhat doubtful.

Business.

The business of Alta was never in a more flourisbing condition than at present. The bnsinese houses coneist of six large atores, three drug stores, four billiard halls, two breweries, two bakeries, three saw mills, two livery etables, about thirty saloons, three hotels, ten restaurante, two meat markets at Alta, and one at Grizzly Flat; one assay office, and the inevitable telegraph and newepaper, both of which do a good businese.

The Mines

Are all that can be desired both in permanence and quality of ore, with the exception of perhaps the Emma which has been fairly robbed to pay a dividend on a capital of five times what the mine would warrant; still the mine is a good one and keeps up a steady production of from 10 to 20 tone daily of first-clase ore and about 100 tons of second-claes, which is concentrated to about 10 tons of an average value of 250 ounces per tou in silver, and from 40 to 60 per cent. lead.

The Flagstaff,

Situated west of the Emma on the same on the hill, is developed to a depth of between 600 and 700 feet, and ships 125 tons a day, of an average value of $150 in silver, besidee from $20 to $118 in gold. The ore carries from 20 to 40 per cent lead, and a small percentage of antimony.

The Last Chance Mine

Situated above the Emma, aud near the summit of the Emma Mountain, produces a fair quantity of ore, averaging 80 to 90 ounce of silver to the ton.

The Montezuma mine is in the same group as the Laet Chance, and producing similar ore; the shipments amount to about 40 tous per week.

The Savage mine, in the same group, is of the same character of ore, and producee from 10 to 15 tons per day.

The Hiawatha Mine

Is particularly intereeting for the beauty and richness of its ores, aseaying from $600 to $1,450 per ton. Carbonates of copper and lead, witb half decompoeed galena from the chief part of the ores, all beautifully intermixed through the vein. It belongs to the eame group and company as the Savage and the others.

The Victoria and Imperial

Consolidated Mining Co. have a large force extracttng ore, and developing their mine; and a new strike made in the tunnel not known to belong to any mine, appearing on the surface. The ore aseaye high in both lead and silver, and if found to be a real vein, will be one of the most valuahle discoveriee of the present season. The otber mines of the group are all nroducing good quantitiee of ore except the Imperial which will shortly be reached by the tunnel, and will then be tested for ore at a depth of about 550 feet from the surface.

The Silver Belt Tunnel has etruck a body of milling ore in the Skipper mine, averaging from $40 to $60 per ton; it is the intention of the company to erect a mill for the reduction of tbeir ores.

The Vallejo Tunnel and Mine ehips about 10 tons per day of excellent ore and the South Star about the same quantity. Both of theee minee are eituated on Emma Mountain between the Emma and Flagstaff minee.

The Davenport is looking splendid and ehips from 20 to 25 tone per day of ore worth from $200 to $250 per ton.

The Mathilda is close to the Davenport, ehips 10 to 12 tons daily of ore similar to tbe Davenport ore.

The Oxford and Geneva Tunnel has 350 tone of ore on the dump ready to ehip ae eoon as the road ie finished to the mine. The ore ie worth about $135 per ton in silver and a small amount of gold.

The Wellington Mine

Ships from 15 to 20 tons a day; the ore averages from 80 to 170 ounces of eilver and 48 to 70 per cent lead.

It will be seen by the foregoing that the mines have been purchaeed in groups and are now being worked ae groups under one management. Thus the Silver Belt group comprises five mines, the Victoria and Imperial has four minee, the Windsor Utah four, and so on. These can generally be worked through one tunnel, and experience hae proved it to be cheapest in the long run to tap the mines deep with long tunnels, thereby affording drainage to the minee and saving the expense of hoisting the ore.

J. H. MORTON.

Alta City, Aug. 25, 1873.

Treasure Hill, White Pine.

Treasure Hill being tbe principal locality where the precious metals eent from White Pine are discovered, shall alwaye receive through our columns its sbare of attention. A visit during the paet week revealed the mining interests to be in good condition and ore plentiful, particularly in the Edgar mine. Work in the 150-foot level ie being pushed ahead with all epeed, and reveals immense quantities of ore with a splendid prospect of continuance. The later workings ehow tbe theory advanced in the *News* some time ago to be a correct one, which was, that the ore body could be traced into the Hill, and the main vein be found on the eaetern instead of tbe western slope. The main drift from the Edgar shaft is now being followed in good ore toward and under tbe workings of the Hidden Treasure, and, as progrees ie made, the vein ehowa a decided pitch downward. We were allowed to eee the result of several blasts at the time of our visit, it being nearly eix o'clock, and the shifts in the act of relieving each other, which gave ue a better idea of the immense amount of pay ore being taken out at this time. The usual average of 30 tone per day is being ehipped from the mine, and the amount could easily be doubled without much extra exertion. As Capt. Turner, the Superintendent, has just returned from below we anticipate renewed activity, and a probability of another mill being started on the product of thie fine property. The mines of the Eberhardt & Aurora Company are still looking well, and continue to produce the usual amount of fine ore. The Peerlese Chamber, particularly, showe no eigns of diminution, but, on the contrary, gives rise to great hopes of its permanency aa an ore-producing locality. The contract for crueh-ing ore for the company entered into with the Stanford mill, is nearly completed, and, by the firet of next month prospecting will be vigorously pushed ahead on other portione of the mines to enable the company to open ore bodiee sufficient to supply the new mill, now in course of erection, during the winter monthe. The Diamond Drill ie being steadily run on Chloride Flat, with no important results as yet, though great faith is expressed in its ultimate success as an ore finder. Should it be demonstrated that mineral exists at tbe spot where the drill is being worked, the fact would accrue to the advantage of all ownere of locatious in tbe vicinity, and the number of men employed be doubled at once. Every day adds additional proofs of the existence of an ore-channel running through Treasnre Hill, at a deptb which will sooner or later be discovered; then we can look for permanency in White Pine District. The various business housee on the hill are pursuing the even tenor of their way and are doing a good businese, and all bopeful of the future.—*White Pine News.*

SCIENTIFIC PROGRESS.

Ozone—New Discoveries.

The ghost of Schönbeiu has been caged at last. For a ecore of years this mysterious agent, half material and half spiritnal, perplexed the adepts in chemistry, and evoked theory after theory in the vain endeavor to arrest it and subject it to law. All that its discoverer accomplished was to demonstrato a shadowy existence for it, and to deviso some chemical tests of its presenco. In the *London Lancet*, for August, is an editorial article giving a short sketnh of its history, and explaining the mode in which Professor Odling and Sir Benjamin Brodie, among others, recently succeeded in bringing it among tho tangible substances in chemistry. It appears that Schönbeiu's investigations were entirely qualitative, and that he never attempted weighing and measuring. By passing electricity through pure, dry oxygen, there is a contraction of volume, amounting as a maximnm to one-twelfth of the original measure. That the residual gas posesses certain peculiar oxidizing properties, different from pure oxygen, and that it has a pecnliar ndor, was everything that conld ho said of it. Chemiste had to contend themselves by guessing that it was an allotropic form of oxygen. Its name—ozone—simply indicated that it had a smell—nothing more. But the quantitative experiment, just mentioned, furnished the key to more definite reaults. When the oxygen thus ozonized by electricity was heated, the gas was restored to ite original volume, and again became pure oxygen.

Now, the problem was to abstract the ozone from the ozonized oxygen, and thue determiue its volume. Advantage was taken of the affinity of the ozone for mercnry, and by shaking the gas and the metal togeter, the latter wae oxidized by abstracting the ozone, and pure oxygen was left ae the residue. But the surprising feature of the process was that there was no diminntion of volume in the gas by the abstraction of ozone. The myeterioue agent had occupied no space. The same result precisely attended the nee of iodide of potassium and other agente capable ot being oxidized by ozone.

It was at thie embarrassing etage of investigation that Professor Odling came forward with what has since proved to he the trne explanation nf the apparent absurdity—the true theory of ozone. He pointed ont that these experiments could only be explained by assuming that ozone was a more condensed form of oxygen, and that when mercury or iodide of potassium was oxidized by it, those snbstances really removed only a portion of oxygen—that portion, in fact, which had previously been condensed. He suggested that, whereae ordinary oxygen contained two atoms in each molecule, ozone might contain three in a molecule of equal volume.

If this ingonione theory he correct, it ie obvions that ozone ehonld be half as heavy again ae oxygen—should have, in fact, a epccific gravity of 24, ae compared with hydrogen. The verification was not long in coming. Soret, iu 1865, lighted on a substance—oil of tnrpentine—which had the property of absorbing, not one atom, bnt the *whole molecule* of ozone. Following the imaginary illustration used before, he found that, if the 92 volumee of ozonized oxygen were treated with oil of turpentine inetead of mercury, the volnme wae reduced to 76, ehowing that 8 volumee of oxygen wbich had disappeared during the formatiou of the ozone must have combined with 16 more volumee of oxygen to form 16 volumee of ozone, and that ozone wae therefore really half as heavy again as oxygen. Soret also determined the deneity of ozone by a method of diffusiou, with eubstantially the eame result.

Following up the enqniry, Sir Benjamin Brodie, after several years of labor and stndy, has confirmed the foregoing theory. He diecovered that chloride of tin and hyposulphite of soda, ae well ae oil of turpentine were capable of absorbing the whole of the ozone and the resnlte all agreed in giving for ozone a density of 24. It is surmised that not ouly will their be discovered some ready applicatious of the agent to practical purposes, but that it will open the door to new viewe on the subject of chemicul constitution.—*Pacific Medical and Surgical Journal.*

Artificial Milk.—From the reports in circulation it would seem as if science were ehout to make cows superfluous. Artificial milk has been prepared by a French chemist from sugar, dried whites of egge, carbonate of eoda, olive oil and water. By substituting gelatine for the whites of eggs, and with less admixture of water, cream is obtained. Another chemist, Gaudin, in diecussing the preceding suggeetion, gives his testimony ae to depriving fate of all the unpleaeant odor by mere eubjectiou to an appropriate temperature. He also states that very good artificial milk can ho prepared from bones rich in fat, by purifying this fat by meane of super-heated steam and combuing the fat thus obtained with gelatin. Thie milk is, he saye, almost like that of the cow; and when kept, acquiree first the color of sour milk, then that of cheese. The gelatin in it represente the caseine; the fat, the butter; the sugar, the sugar of milk. It serves for the preparation of coffee and chocolato, of soups and creame of excellent flavor, and its voet is but trifling.

Agassiz's Plan of Teaching at Penekese.

The chief aim of the school is shortly pnt in these few words. Obeerve for yourselves. Agassiz made all the studente nnderstand before coming that books were not to he nsed as we use them in our schonls; that thore were to he no recitations, no ordinary routine of any kind. Hard work is the condition on which one remaina here, bnt this work is strictly in the way of nbservation and the collection of specimene. 'Never mind abont namee,' says our master every day; 'etudy the thing. You have nn right to know the name until yon are at least familiar enough with the object to describe it.'

Behold, then, tho Anderson School at work. Perhaps there is a lecture or two after breakfast; if so, the little boy whoee business it is will blew a horn iu due time and yell 'Lecture' between the blasts at the top of his voice. One or the other or both these efforts bring the fifty together. Glance over them a moment. Yon never saw a school just like it before. There are faces old, aud young, and half-way, also. Thero are gray hairs uot a few. Thero are those who have already spent yoare in seientific etudy, and those again who are far bohind them in all save earneetness. Of late active work has snperseded lectures to a great extent, eo we will say they have not, and bctake ourselvee to the laboratory. What a buzz! Most settle down at their tablos to work—some stroll off for specimens. All follow their own sweet will as to what they should do, only they must do something, and that something mnst accord with the plans of tho school. One is diesecting a fish, another a bird, another a turtle. Here one ie husy watching the movemente of a jelly fish; there another has forgotten this world in that strange other one which the microscope nnveils. A botanical group ie gathered over a dish of eea-weed. All day yesterday and the day before wae that same gronp over that same dish, for the stndy and classifieetion of the algæ is no play. The long shelves above the tables are already loaded with epecimens, dried in alcohol, which the students are to carry to their own schoole, ae nnclene for future amnsement.

Out doors they are bnsy, too. Sea animale are interviewed in their owu homes, and forthwith it is bruited abroad how they keep honee. Tho little birds yield, perforce, their precions secrets, not liking at all to be watched. Here a student is netting butterflies; there another ie hammering a boulder. Down in the ehallow cave two or three are wading about with dipnets. Esch is husy about that which he likee, for specialism is encouraged.—*Inter-Ocean.*

An ominent French astronomer asserts that the only correct theory of the planetary system is, that beeides the planete Mercury, Venus, the Earth and Mars, there exiets between the Sun and Mercury a ring of asteroide, whose total mass is about equal to the mase of Mercury. At the same dietance from the sun as the earth there exists a second ring of aeteroide, whose mass exceeds the teuth part of that of the earth; the total mass of the small planets situated betweeu Mars aud Jupiter exceeds one-third of the mass of the earth; and the masse of these last two groupe are complements to each other. Ten times the mass of the group near the earth, also three timee the total mass of the small planets between Mare and Jupiter, form a sum equal to the mass of the earth. The laet conclusion depends upon the distance between the earth and the sun, as ascertained hy the transits of Venus, the measnrement of the distance being generally admitted by astronomers to be as accurate ae is attainable.

M. Chary has recently made experimente with the view of utilizing cinders which have dropped through the grate. He auggeets passing condeneed air over red-hot cinders, whereby carbonic oxide is formed, which gives a flame of eeveral feet in length, well adapted for boiler heating. The greateet difficulty lay in the nltimate removal of the refuse cinders. From his ehort experience in thie dirccticn, he calculates that 2 kilometree of cindere, sorted by hand, giving a heating effect equal to that obtained by 1 kilometre of coal. It has been argued that the mode of separation wae of the greateet practical importance. The wet proces was not to be recommended, on acconnt of the extensive drying grounds required, and the fact that after all the piecee had to be used in a damp etate. A current of air has heen suggested as an agent for separating, or, as it were, winnowing the bits. Another authority on the subject states that the amonnt of incombustible matter in the cinder amounts to 1.15 per cent. by volume, or 26.7 per cent. by weight.

Transplanting the Cornea.—Dr. Wolf, of Glasgow, reports, in the Glasgow *Medical Journal*, the case of a man whose coruea was adherent to the lcwer lid, in consequence of a burn. He dieseeted off the lid, and sutnred on the raw surface the cornea of a rabbit, taken off while the animal was under the influence of chloroform. The operation resulted in usefnl eyeeight. A second case in given, eomewhat eimilar, the reault of which wae equally favorable.

Schwalbe has found that if oil of mustard be added to cow's milk, in the proportion of one drop to 1.1 dram, the milk doee not coagulate, even after being kept for a considerable period; but that the caseine is transformed iuto albumen. If thie discovery, says *Les Mondes*, is confirmed, it will be of considerable importance in the printed fabric industry.

MECHANICAL PROGRESS.

The Railway of the Future.

Railroadiug has hitherto taken most of its lessons in improvement from England. Our necessities for transportation were so great that the most we could do for many years was to build a line with a single track and sidings. Terrible disasters and public clamor at length combined to induce the leading companies to build double tracks, although a large majority of the American lines etill have only single tracks and sidings. The inventiou and nniversal introduction of the magnetic telegraph along railways were of great nse in facilitating operations, nbviating collisions, and increasing the general speed. Gradnally the rail has been improved by the nse of steel, the road beds have been ballasted with stone, locomotives built for alpine grades, inclined planes and etasionary engines increased, the passengor care improved, coal eare built of iron, bridges built of iron, and arrangements made to enable engineers to scoop up a full supply of water from a tank, running at full speed, without etopping at the water statioue.

And now, American railroading, prosperoue, rich, powerful, takes leave of the European model and strides ahead on a new path. The leading company in Ponnsylvania is now building quadruple tracks to separate its way bnsiness from the throngh bueiness, and so increase the general epeed of all. Thero ie nothing like thie in England. It is a step forward for ourselves, and our impression ie that it will be a great succees. Let the reader think of a railway, carrying eight raileall the way through from Philadelphia to Pittsbnrgh, and he will have an idea of what the American railway of the fulnre ie likely to be. Not only will all the general roadway have to be donbled, bnt the width of the bridgee and tunnels increased, and new sidinge built at convenient pointe.

Theee arrangements will go far to eolve the problem of how to increaee toe epeed of traine with eafety, at which so many have been working. But, in all probability, higher speed than any attainable even in this way, will be demanded and in eome way obtained. The giant railway, with an enormous rail and an engine of twelve feet driving wheel in diameter, is not a dream, but a possibility. And if a train can be driven a hundred miles an hour with snch meane, the capital can he had to build a road and make the experiment. With such a line, we could breakfast in Philedelphia and snp in Chicago on the eame day. And the jonrney from Philadelphia to New York wonld not occupy an hour. The National railway promises to do it in two houre. All these things are among the neceesities of our vast conntry, with its great distances and diverse interests. And the money spent in tryiug theee experiments would not be squandered, but applied to a very useful purpose. In the meantime the qnadruple tracks will very mnch enhance the rapidity of traneit.

Steel Tires for Railway Wheels.

A new process for making eteel tires is employed at the great mannfactory located at Crowe, England. In this process, as described, the steel is caet in the form of truncated conee, the emallest end to form the outeide of the tire. While still hot, it is introdnced to the horizontal steam hammere. Theee consist of a couple of enormous massee of iron, each running on a little track, and moved back andforth by means of piston and rod, and by a large eteam cylinder behind each, the eteam valve of each of which cylinders ie operated by a common lever. By paeeing through two sets of these hammers the steel is thoroughly worked np, and leaves it in the form of a thick disk. Carried from these, it paeees to an upright hammer, with a eharp, conical end to the etriking part. This eoon forcee a hole through the disk, which, being turned ronnd and round, and over and over, becomes a thick ring. Again heated, it goes to another hammer. This hammer has a very heavy anvil, with a peculiar slope to one side, from which projects a stiff horn; upon this horn tho ring is hung. The face of the striking pert ie formed to the elope of the rim and flange of the wheel, and, as the workmen manipulate the wheel under ite blows, elipping one portion after another of the rim up to receive the stroke, the whole tire gradually expande to the requisite diameter, and ie ready to be turned on the inside and driven on to ite wheel.—*Stove and Tin Trade Journal.*

Mr. Wood, the engineer of the Tees Iron Works, Middlesbrough, and Mr. Joseph Woodward, of Darlington, whose patent has been acquired by the Tees Scoriæ Brick Company, are each busily etriving to bring to perfection their respective eyeteme of utilization of elag. Mr. Woodward confinee hie attention exclusively to the manufacture of bricks, and for some time past he has been exerting himself to reduce the weight of the brick, eo ae to give it a better chance in the market ae compared with ordinary clay bricks. In thie effort he has been largely snccessfnl. Some bricks made last week at the Clay Lane works, of Mr. Thomas Vaughan, did not weigh over eix pounds each, while an ordinary olay brick varies in weight from six to nine pounds. If bricks of this epecific gravity can be uniformly produced from elag, the success of Mr. Woodward'e eystem appears to he assured.—*Colliery Guardian.*

Danks' Puddling Machine.

In the ordinary pnddling furnace it takes abont two hours to puddle a charge, but the Danks machine does the eame work in less than fifteen minntes. Beeidee thie, the quantity of iron under manipulation is much greater —the hall puddled in the Danks furnace weighing 10 cwt., whereas in the nsnal pnddling furnaco, the rule ie to puddle four halls together of one cwt. each. The consnmption of coal per ton of puddled ball has now been redneed to 15 cwt. at the Teesside works—that is, where molten metal is put into the furnace; but if cold metal ie nsed, it requires 20 cwt., or thereahouts. There is a difference of four to eight cwt. per ton as compared with the consumption of fuel in the ordinary furnace. Some of the resnlte obtained at theee worke by the Danks machine are quite nniqne in the metallurgy of Cleveland. Only a few daye ago, pnddled bar made in the rotary furnace wae rolled into an angle 75 feet long, the angle being three inches by three, by three-eighte. A rail made last week from the eame iron wae exposed to a most severe test, and peesed the ordeal triumphantly. The rail was placed between uprights—the bearings being three feet three inchee apart—and tested with a weight of 648 pounds, giving it one blow of 10 feet, and four blows of 18 feet. On measuring the rail afterwards, it hent just nine inchee, and did not ehow the least sign of fracture. It is important to bear in mind that this rail wae made without piling, an operation calculated to produce lamination, and deteriorate the durability of the rail, although it is a neceesary part of the preeent mode of manufacture. The reheating of piled bare also reqniree a good deal of labor, which is hero altogether obviated. Compariesns made at the Teeeside worke show that the Danks mschine effects a saving ae compared with the ordinary pnddling process of 8 to 10 per cent. of the pig metal put into the furnace. If theee resnlte are borne ont by the experience gained at the other worke above mentiond, there is no room for donbt, that the daye of ordinary hand puddling are very nearly done.—*Newcastle Daily Chronicle.*

International Bridge.—The river piers for this bridge across the Niagara at Buffalo have all been completed except one. In preparing for thie last pier it was found that the river bed wae covered with eome 10 feet of gravel, which it was necessary to remove. The removal has been completed and work begun on the foundation of the pier. It is expected that it will be finished in about four weeks.

The bridge acroee the main river will be 1,968 feet long. Beginning at the Canada shore, there will be three spans of 190 feet clear, then three epans of 240 feet, then the draw spen, which will have two clear openings of 160 feet each, then another span of 190 feet will bring the bridge to Squew Island. Acroee the island the distance is about 1,200 feet, and then there is another bridge across Black Rock Harbor 517 feet long. In this last bridge there ie a draw span with two clear openinge of 90 feet each.

The euperetrnctnre will be the Pratt trnee and is being bnilt at the Phœnixville Bridge Worke. A novel plan is pursued in placing the iron epane upon the piers. They are bnilt upon a framework over a number of pontoons, which act in the manner of a dry dock. The pontoons are carefully dropped between the piers, and when in position water is let into them, and the iron trues ie eettled into ite exact place on the piere.

Experiments are bearing ont the thonght that at no distant day eteel will enter very largely into the construction of marine machinery. The great eaving in weight will be one of its best recommendations, but for the present it is not quite clear as to how the treacherous natnre of much of thie materiel can be controlled, so as to insure a uniformity of etrength throughout a large mass. A material known as "Whitworth Compreeeed Metal" has recently been experimented with, giving excellent results. It ie claimed that thie metal, jndiciously employed, combines the tonghness and uniformity of the best malleable iron, with the tenecile and crushing etrength of the beet manufactured eteel.

The lateet method of eonsuming coal duet has been propoeed by a New Jereey projector. It is more particnlarly designed for locomotivee, and consiets in throwing the anthracite dust upon a fire eterted, and to the extent of one-half the fuel reqnired, kept up with bituminone coal. The tender is to he mede in two parte for the two kinds of fnel; the fire is to be made at firet wholly with the bituminous, and so maintained until the steam-gauge ehowe 100 pounde preseure in the boiler. The anthracite dust is then thrown into the furnace with a shovel in inetalmente alternate with the othcr.

In every car on the Counecticut River Railroad there ie exhibited a placard, which ie changed on leeving every station, recording the name of the next etation, and etating whether it connects with any and what other lines. It must he a very convenient practice, if it doee not cauee delay.

The Amee Company, of Chicopee, have nearly completed one of their largest eize lighthouse lanterns, for Cape Fairweather, Oregon. It ie 20 feet high and 16 feet in diameter.

THE City of Mexico is excited over the discovery of gold mines bstween that place and Tolina. A company has besn formed to work the old Valinciana mins near Guanajuato, and heavy machinsry has hesn added to pnmp out the shaft.

CALIFORNIA'S birthday was celebratsd on the 9th inst. in this city, and gsnsrally throughout the interior. That date was the 23d anniversary of her admission to the Uuion. Appropriate speeches and fsstivities were observed by the pioneers in different parts of the Stats.

Our Weekly Stock Review.

THURSDAY EVE., Sept. 11, 1873.

The stock market this week has not been unusually lively, hut a fsw stocks have fluctuated snough to kcep it from getting as dull as has been ths cass of lats. The lowness of ths water in the Carson river reduces the hullion production of the Comstock, hy stopping some of ths mills and rsducing ths uumher of stamps on others. As a consequence some of the mines have been compelled to lessen their ore production and discharge some of their men. Ore is, howevsr, accumulating on the dumps of thc mines, and when the wet season comes along again, the mines will do better and the Stock market prohably liven up again.

The injunctiou on the Raymond & Ely mine has heen raised and ths mine is again at work. A dividend of $3 per shars or $90,000 was distrihuted this week, the first sincs last Fcbruary. This mine has had a good deal of troubls in legal mattsrs ever siucs it has proved itsslf worth something, as is usually the case. Ths way the injunction on ths Raymond & Ely, spoken of ahovs, was ohtained hy the Kentucky Company, is explained hy the Pioche *Record* as follows:

"It will be remsmbered by our readers that there is and has heen for a very long time a suit pending in the District Court of this county, hrought by the Raymond & Ely Company against the Kentucky Company, in which an injunction was granted against the latter company, and which is still in force, the suit not having coms to trial. The Kentucky Company at one time contemplated removing this suit from the State to the Federal Court, but as both companies heing foreign corporations, the conclusion was arrived at that the case could not bs rsmoved, neither could any action be brought hy the Kentucky Company against the Raymond & Ely, for the same reason. The Ksntucky Company, however, heing a foreign corporation, might bring an action in the Fsderal Courts against any number of citizens of this State who wsrs found in possession of or working miuing grounds claimed by it. The present action is therefors not brought against the Raymond & Ely Company as defendants, but is an action against the employés of ths company in possession. The Kentucky Company has thus adopted this method of doing indirectly what it could not do directly."

Howsvsr, the Kentucky peopls knowing that ths stoppage of the Raymond & Ely, for a month, would cause soms troubls and distress to a numher of men, the Judge of the Supsms Court modified ths rsstraining order to taking a bond, which was executed in this city, hy Messis. Robt. Morrow and Wm. Sharon, in ths sum of $500,000 each. This hond will cover all hullion taksn out in the time—Oct. 6.

Ophir has been ths leading feature on the market this wesk, it having jumped up and down in a wonderful manner under the influencs of contradictory reports as to ors discoveries.

Ths Minnesota mine (Idaho) has declared a dividend of $1.50, aggregating $30,000, the sams as declared last month. This mine is in the same district as the Golden Chariot, which pays also this mouth $3 per share, or $30,000. It is said that the Mahogany, in the same viciuity, will shortly pay dividends. Belcher pays this month $5 per share, or $520,000, and Crown Point $4, or $400,000.

A suit is Dow being tried in the Fourth District Court, which is of intorest to hrokers, as the decision involves ths legality of transactions occurring every day. On the 7th of last April, Isaac Levy purchased, hy H. Schmiedsll, Trustee, 20 shares of Meadow Valley stock, which Schmiedell endorsed aud handed to Levy. On the 8th of April, Lsvy lost the certificate and he advsrtised ths loss. In the meantime the certificate was found by soms nnknown person, who sold it, and on the 19th of May it reached B. F. Sherwood and came into his possession. He presented it for transfer to the Msadow Valley Co., hnt they said Mr. Levy had represented it as lost and that a duplicate had beeu issued to him. As the company refused to make the transfer, Mr. Sherwood sued them to compel them to recognize his claim, he having purchased it in the usnal way. The company say they ars not responsible, as the stock was not transferred on the books by the parties who hold it hefore Mr. Sherwood got it. The decision is waitcd for with interest.

THE Mineralogical Notss on Utah, Califoruia aud Nevada, on auother page of this issue, and continued from page 133, were published by Professor Sillimau in the *American Journal of Science and Arts*.

THE taxahls property in Salt Lake City is valued at over $7,000,000.

MINING SUMMARY.

THE following is mostly condensed from Journals published in the interior,in proximity to the mines mentioned.

California.

AMADOR COUNTY.

FINE CLEAN UP.—Sattor Creek *Independent*, September 4: The Consolidated Amador Mining Co., after a run of 28 days, cleaned np a little over $28,000. The mill has only been running 20 stamps the past mouth, and we consider this n very clever return for them. The rock now being worked will ran over $21 to the ton. A few mines in the county are more ably managed than this, and hnt few richer. The machinery and works are all in fine order.

THE GOOD HOPE.—Work on this mine, loeated near Jackson, is being pnshed rapidly, and Mr. Poters, the principal owner, is confident that within the next forty ft. he will find good paying rock. It is the intention of the compauy to erect a fine 20-stamp mill soon.

KEYSTONE MINE.—*Independent*, Septsmber 5: This mine had a very handsome clean-up last week, bat we did not learn the amonat. Never before has the work beeu moro successefully pushed than at prosent, In the lower levels the rock looks fine, and improves in richnsss. The hanging walls are very firm and heavy, and the foot walls are splendid. The sulphurets are exeeedingly rich, and are being worked to advantage. No mine in the State has a moro flattering futare and but few are better managed.

KEYSTONE.—Suttor Creek *Independent:* Never before has the work been more successfully pushed than at present. In the lower levels the rock looks fiae, and improves in richness. The hanging walls are very firm and heavy, and the foot walls are speudid. Tho sulphurets are exceedingly rich and are being worked to advantage.

BUTTE COUNTY.

MOAR QUARTZ.—Bntte *Record*, Sept. 6: We learn that Messrs. Plum & Maddox, of Forbestown, have struck some very rich quartz, in an extensive vein, 600 ft. from the rich ledge of Roberts & Co. They exhibited some rich specimens, which proves the richness of the lead. Forbestown promises to become one of the best quartz mining localities in the State.

PLACER COUNTY.

RICHER YET.—Placer *Herald*, Sept. 3: The Crater Hill mine, owned by the St. Patrick Company, is undoubtedly the best quartz mine in this district. The ore, thus far, from this mine has yielded on an average about $42 per ton, and what is most flattering, the deeper they get the richer and more extensive the ledge becomes. The main shaft is now down ahont 215 ft. deep, and in the bottom the ledge is about 28 or 29 inches thick, and yields more gold per ton than at any other point. The St. Patrick Company have spent freely of their immense meaus in thoroughly and systematically developing the quartz mines of this section, and it is with much pleasure that we chronicle their success.

SHIKE. — *National:* Recently, at Newton Flat, the O'Neill brothers strnck what is supposed to he the back channel in their tunnel, or side drift, and found it to be extremely rich. In a short time they washed out $24 in heavy coarse gold. The claim will, doubtless, prove to be one of the richest on the north side of the valley.

NEW CANAL.—The capacious new canal which the company, at Devil's Elbow, are constructing for the purposs of taking the water of Rock Creek directly to the mouth ot the tunnel, is nearly completed. Those who have not visited that locality recently would he surprised at the amount of work which is heing done.

SIERRA COUNTY.

GOON PAY.—Mountain *Messenger*, Aug. 30: We learn from reliable authority, that the Bunker Hill claim at Little Grizzly, formerly known as the Democrat, pays $6 for every car load taken out. The claim paid well years ago, hut was supposed to he worked out and was abanhoned. The company have got the claim opensd in good shape, and it hids fair to he one of the best claims in the county.

MINE SOLN.—The Pioneer tunnel at Sebastopol, has bsen sold to Mr. Billings. The tunnel was started in 1856, and work has been prosecuted on it intermittently since then. Many thousand dollars have heen expended and a long tunnel run, but pay was not reached.

PROSPECTING.—A company have commenced runniug a tunnel to prospect the ground under Saddle-back. They have commenced work near Merideth's upper sawmill, near the Eureka and Poker Flat trail.

SIERRA COUNTY.

EAST FORK M. Co.—Mountain *Messenger*, Sept. 6: Several hundred ft. above the river the ledge has been tapped and considerably developed. In this working the ledge is as much as 30 ft. wide, and rock taken from any portion of the prospect works well. Quite a quantity of rock has heen takeu out and saved tor the time when a mill shall he erected. The Company is now engaged in runniug a lower tunnel, 140 ft. of which is already completed and it is hoped to tap the ledge in ahout four months, more or less. The lower tunnel is nearly all in a kind of hard bluish rock lying between the foot wall and the ledge, and nearly all of it blasting rock. The tunnel is heing pushed along a well defined foot wall, hy following which, it is expected to strike the ledge, of which there seems every prospect, the wall tending gradually inward for some 50 ft., and quite sharply for the last 20 ft. of tunnel run.

The Rocky Point Ledge is sitnated about two and a half miles above town on the East Fork. The ledge, where it has been tapped, shows about 15 ft. of as solid and fine a looking body of ore as one often sees, with well defined and smooth walls, both foot and hanging. Drifts have heen run along both walls, and a shaft sunk by the foot wall, and all these developments show the ledge solid and samples taken from every point reached on the ledge, prospect exceedingly well. Mr. Picket, the present manager of the work, has started a tunnel some 15 ft. above the river, and appearances indicate that the ledgo will be reached after running 40 or 50 ft. more of tunnel, which is progressing satisfactorily, and is being heavily timbered and constructed in the most substantial manner.

NEVADA COUNTY.

GOLD TUNNEL MILL.—*Transcript*, Sept. 7th: The mill, which is a new one, has 10 stamps, and is arranged for working by water power. The wheel is 30 ft. in diameter, and, with plenty of water, is capable of running a battery of 20 stamps, but at this season of the year the supply of water is very limited, and only sufficient could be obtained to run five stamps. The company, however, are not allowing the waters to remain idle, as the stamps are running day and night. The machinery of the mill and all the appurtenances work smoothly, no jarring or grinding, showing that everything is eveuly adjusted. The hoisting works are run hy steam, and are situated ahont 200 ft. above the mill.

LOWELL HILL is situated about 8 miles northeast of Little York, and about 18 miles from this city. It has a population of about 200, and the nnmber of men employed is 75 or 80. Mining is mostly done in this locality by drifting. The gold is mostly coarse, and occasionally some very large nuggets are found.

THE SWAMP ANGEL Co., whose claims are located on this hill, have very rich diggings, and employ 5 men. A few days since, while drifting, they took out a specimen worth $33, another worth $12.64. Out of the 40 ounces which they cleaned up only 3 ounces were fine gold, the remainder being nuggets, ranging in value from $30 to $5. This company is now husily engaged in building sheds and dumps, in order that mining on their claims may not be interrupted during winter.

HILL & Co. come next, and having cleaned up $1,700 a short time since, are now running another hed-rock tunnel, in order to get to the hottom of the rich-paying chaunel in the center of the hill.

MCCAM & Co. have commenced a main tunnel, for the purpose of striking the channel, and expect to have it completed hy the first of May next, when they will be sure to reap the reward of their labor.

MACKIN & Co. struck a fine prospect just previous to the water failing them, and have since been workiag all the time in drifting and fitting up for winter.

Nevada.

BRISTOL DISTRICT.

SULTAN.—At a depth of 140 ft. the ledge dipped from the shaft, but yesterday they struck it agaia, and from appearances, richer than ever. The specimens sent into town yesterday strongly resembled the richest ores found near the surface in the celebrated Bowery mine, well known to all old residents of Pioche.

CAVE.—Work is progressing as usual, and ore is heing coustautly placed on the dump.

ELY DISTRICT.

RAYMONN & ELY.—Pioche *Record*, August 31: The ore in the upper levels is looking very well. There are 7 stopes of first-class ore hetweeu the 4th and 5th, on the west side. The work of sinking the shaft for the 10th statiou has been commenced, and a progress of 15 ft. has heen made. A connection has been made with the Hermes shaft at the Raymond & Ely's 6th level. Two drifts are being ran on the 9th level—one south, to cut the ledge at right angles at a distance of 115 ft. from the shaft; the other southwest, to cut the ledge at a distance of 200 ft. from the shaft. About 75 ft. of the former and 40 ft. of the latter have heen completed. The last bullion shipment was valued at $41,000.

SILVER PEAK.—The sinking on the incline continues. Since the new machinery hegan work a progress of 30 ft. has been made, 10 ft. having heen sunk in the last week. The ore in the hottom of the shaft is very good. Ahout 70 tons have heen shipped during the month. The assays of ore taken from the hucket were: On the 26th, fine, $103.62; coarse, $427.04. On the 28th, fine, $72.26; coarse, $106.81. On Saturday the ore samples gavo $169. The bullion returns will he made on Monday.

MEADOW VALLEY.—The appearance of the mine is favorable, aud ore is being taken out of No. 3 shaft from the 6th, 7th, 8th and 9th levels. Work at No. 7 has been discontinued. This, however, we are informed is probahly a temporary suspensiou only. Work at No. 5, the machinery on which was damaged some time ago, will he resumed to-day.

PIOCHE.—There is no change in the nnmher of men workiug, nor in the quantity of ore taken out. During the past week 80 tons of ore have heen shipped to the mill. Crushing was commenced on the ore from this mine on Wednesday. The whim on the new shaft is now completed, and a new contract having heen let, the work of sinking will be resumed on Monday.

WASHINOTON & CREOLE.—Aa drifting is continued, east and west the ledge continues to improve. A drift is also being run to the south. The stopes are looking much better than during the previous week. From aeven to eight tons of oro are taken out daily, and there are now ou the dump 400 tons. This ore is of the same grade as tho last milled, which gave $90 per ton. Milling will begin between the first and fifth of September.

SPRING MOUNTAIN TUNNEL.—Work still continues in sinking on No. 3 ledge, hnt without material change—having left the ledge in order to give the shaft a more uniform conrse. The work will bo continued in this condition for some time longer, when, shonld the vein not straiten up and resume its coarse, a cross-cut will he commenced at the 150-foot level to expose it, when it is believed good ore will be found, as nll signs point in that direction.

NEWARK MINE.—This mine is employing 70 men. Have had milled this month 20 tons of first-class ore, and are taking ont and shipping to mill daily 20 tons from the 500-foot level. The 400, 600 and 700-foot level drifts are heing driven south from the main shaft, to cut the ledge as fast as possihle. The veiu will be cut at all three points withiu 40 days.

SAMANTHA.—This mine has bsen opened by a shaft sunk on the ledge to the depth of 115 ft. At this point the ledge is about 4 ft. wide, and shows 2 ft. of rich ore on the hanging wall. Assays of average rock rauge from $150 and $300.

AMERICAN FLAG.—Rnnning the mill on ore from this mine. The mine continues in about the same condition as when our last report was made. Shaft 700 ft. deep and sinking rapidly, working the nsual force of men.

CHAPMAN.—Running on a vein of ore which looks very promising. It is a vein of chloride ore, ahout 10 inches in width, in a ledge three ft. wide. The drift is being run east from the 420-foot level.

CHIEF OF THE HILL.—A progress of 20 ft. has heen made in the west drift on the 210-ft. level. The stopes have as favorahle an appearance as usual, and some ore is being taken out all the time. There are now on the dump 97 tons of ore.

CHIEF EAST EXTENSION.—A good qnality of ore is heing taken out from the 225-ft. level. The quantity is ahout the same as usual. There are now 25 tons of ore on the dump, and this will soon be shipped to mill.

ALPS.—Resumed work yesterday on the drift in the 300-ft. level. The winze sinking on the vein from the 164-ft. level is down 54 ft. in good milling ore. The vein at this point is from 3¼ to 4 ft. wide.

LOUISE.—A drift is being run from the 200-ft. level ou a small vein of very good ore. This vein has now continued the same for a distance of 75 ft.

PEAVINE.—The new shaft is down 55 ft. Taking out some fair ore from the old works.

BOWERY.—The work of sinking on the shaft is all that is going on in this mine at present.

BNOOKLYN.—No change worthy of note. The vein in the winze maintains its size and average quality of ore.

HAVANA.—Drifting west from the bottom of the shaft. Ore the full width of the drift. Looks extremely well.

MONTANA.—Face of the drift in the 175 ft.-level in spar and quartz; making fair progress.

PORTLAND.—The sinking continues and a small qnantity of ore is heing taken out.

PIOCHE WEST EXTENSION.—A drift is being run to the south, a progress of 100 ft. having been already made.

VULTURE.—The shaft is all ore, some of a very high grade.

SPRING MOUNT.—The only work going on in the mine is the sinking on the shaft.

MAZEPPA.—Working the usual force of hands and sinking the main shaft.

THE CAROLINE MINE.—Pioche *Record*, Aug. 30: The Caroline lode was located in the year 1868, and is one of the very oldest locations in Ely Mining District. On Panaca Flat and vicinity there are only two locations of anterior date, viz: the old Panaca and Mammoth. The Caroline was located under the original mining laws of the district, which, as is well known, are somewhat different from the usual forms of location in the mining camps of the State, in separate locations of 200 feet each, thus: Discovery, 200 feet—No. 1, east. 200 feet; No. 1, west, 200 feet; No. 2, east, 200 feet; and so on. The property known as the Caroline Mining Company was purchased hy its present owners in 1872, and consists of the Discovery claim, No. 1 east and No. 1 west, 600 feet in all. The ledge on the surface is fully ten feet wide, and crops out boldly, being the only place on Panaca Flat where any croppings were to he seen. Assays of the croppings gave from $25 to $50 to the ton in silver. The original locators sunk a shaft 70 feet deep on the ledge on the Discovery claim, following the foot wall, which was principally shale and slate, the usual formation of the Flat near the surface. No material change in the character of the ore had occurred at that depth. The ledge dips to the southward at an angle of 80 degrees. Above the shaft, and lying against the hanging wall, there are two ft. of yellow decomposed ore, which has never heen drifted into. Extreme assays from this body of ore, on the surface, range from $80 to $174 per ton.

On No. 1 east, a shaft was sunk by the discoverers on the lsdge to the depth of forty feet. In this shaft the ledge showed even hetter than in the discovery shaft.

After the parchase of the property hy the present company, the ground waa surveyed and a perpendicular working shaft started, calculated to cut the vein at a depth of 350 feet. The shaft ia a double one, each compartment four hy four in the clear, thoroughly timhered, and in every respect an excellent and creditable piece of work. It was snnk with a windlass 225 feet, when the company concluded to erect hoisting works and open the mine on a larger sud more vigorous scale.

The hnildings comprise the main edifice, ample in size and substantisl in structnre, and a large hlacksmith shop, fitted np with every appnrtenanco for work ou a large scale. The ongine is of tweuty-five-horse power. Mr. Farrell, the engineer, informs ns that with the present machinery he can sink the shaft 1,000 ft., and from a depth of 800 ft. can easily bring to the surface 60 to 70 tons of ore per day.

Tho shaft is now down 250 ft., and making excellont progress, the ground heing favorahle for working. Within the last few feet they have struck into the quartzite, and another 100 feet will, undonbtedly, reach the ledge, when the probability of striking one of the richest deposits of ore ever found in Ely District is as near a certainty as anything can be that is yet unseen. Not a doubt exists in the mind of the Superintendent and owners of the Caroline that the rich body of ore struck hy the Newark in drifting up the hill is the Caroline ledge, and nnder the present efficient management the fact, if so, will soon be demon strated. They are working short honrs, and driving the work of sinking the shaft with all possihle speed. Ahout 650 ft. above ths hoisting works is the main tank of the Floral Spring Water Company, and it is the intentiou to shortly lay a pipe from the tank to the works, thsreby rendering the danger from fire absolutely *nil*. No hettsr prospects for a first-class mine exiets to-day in Ely District.

WASHOE.

BELCHER.—Gold Hill *News*, Sept. 6: The ore breasts on the 1000-ft. level are yielding splendidly. The ore stopes on hoth the 1200 and 1300-ft. levels are looking and yielding remarkahly well. The winze from the 1200-ft. level, 205 ft. from the north line, is down 32 ft., the entire distance in fine ore. The main south drift, on the 1300-ft. levsl, is in 335 ft. south of the north line, and still continues in good ore. The east cross-cnt from the drift is in 50 ft. in fiue looking quartz, with occasional spots of good ore. The south winze from the 1300-ft. level is down 56 ft., still showing good ore. The cross-cut west from the bottom of this winze is in 28 ft., the last 4 ft. in very rich ore. The main incline is down 70 ft. helow the 1300-ft. level, the rock in the bottom blasting quite hard, and the sinking making good progress. The station for the 1300-ft. level is opened, and a drift is being run to cut the ore body and connect with the main south drift from the Crown Point mine on the same level.

SUTRO.—Considerable work is being done on it at the present time, the proprietors expending their money freely in practically opening and testing their mine. They are sinking a new working shaft, which is now 90 ft. deep, in a fine ledge 5 ft. in width, assays from which run all the way from $12 to $100 per ton. It widens gradually as greater depth is attained, and when 10 ft. deeper, or 100 ft. in all, the company propose openiug a station and drifting on the ledge.

GOULD & CURRY.—Daily yield, 50 tons of ore, which is mostly extracted from the second and fourth station levels. The ore is hanled to the mills and reduced as fast as extracted. The cross-cuts east on the 1500-ft. level have developed quite a large body of low grade ore, which is gradually increasing in value as the development progresses. The body of ore recently developed in the east cross-cut from the main south drift on the 1600-ft. level, south of the incline, shows a gradual and very promising improvemeut. A considerable flow of water is coming from the face of the cross-cut, which has not yet reached the east clay wall. The east ore vein will undoubtedly be reached in a very short time.

CROWN POINT RAVINE.—From the main west tunnel at the 250-ft. level the company have drifted 90 feet south, the last 60 feet being in solid, hard-blasting quartz. This, as ascertained hy a cross-cut at this point, is 15 feet wide and assays from $3 to $74 per ton. It is as well defined a body or streak as has been found on the Comstock, and is very likely to lead into something much more extensive and valuahle. A drift, run north from the main west drift, is in ahont 50 feet, and judging from the stringers of fine looking qnartz met with and increasing as the drift goes ahead, the prospects are good of finding just as good a hody of metal-bearing quartz as is found in the south drift. Water gives little or no trouble, and the work goes ahead finely.

BALTIMORE CONSOLIDATED.—The main south drift at the first station is still driven energetically ahead, the face continuing in fair grade ore. Work on the second station is making fair progress with uo change of interest to note. No work is heing done in the face of the main drift at the third station at present. Both the north and south drifts from the main tunnel at that station are being pushed vigorously ahead, runuing nearly parallel with the course of the ledge. Cross-cutting the ledge from these drifts will he commenced in a very few days.

CROWN POINT.—Daily yield, 400 tons of ore. The north and middle winzes from the 1,400-ft. level are pushed steadily downward as fast as the decrease of water will permit, the hottom of both in good ore. The drain of water from the east cross-cuts from the main south drift on the 1,400-ft. level continues up to the full working capacity of the pumps. The main south drift at the 1,500-ft. level is heing driven

[Continued on Page 176.]

A Pertinacious Oak.

EDITORS PRESS:—Though not much accustomed to drawing, I have attempted to sketch a curiosity existing in my immediate vicinity.

It is a "Live-Oak Teee." A *live* oak tree; that is, an oak tree *alive*; though the entire top was cut off, and the "atuh" was deeply girdled with an axe in September or October, 1870; nearly three years ago. I send you my sketch herewith, and I also send you hy mail of same date, a green twig and half grown acorns, and a dry chip, each and all taken from the same tree.

The top is now over fifteen feet high and about ten feet across, and is a mass of limbs and green foliage, apparently as fresh and vigorous as any tree near it.

Mr. Zimry Haun, on whose farm the tree stands, assured me that he did the work with full intent to kill the tree. The top of the tree was cut up for firewood, and the stuh (ahout ten feet high) was deeply girdled before he left the ground.

Now, the chips taken from the girdling are, ae you see "hlack as your hat and dry as a hone." The hark has peeled from the lower part, several inches, as ahown in the drawing. The gap in the hark is at least one foot, and in some places much more than that.

The gash is from 1¾ to 4 inches deep, and the chips left in the bottom of the gash are, as you see, about four inches long.

I present this question to our Botanists. How does the Live-Oak tree grow? Is it endogenous or exogenous? Please illustrate and explain in your valuable PRESS, and send one copy to "Live Oak School," near Gilroy, for the benefit of the class in Botany.

The body of the tree is over two feet in diameter, and growing larger ahove the girdling; helow, the stump is dead and worm-eaten. A. S. DENT.

Live Oak School House, Aug. 23d, 1873.

We have caused to he executed an engraving which will very clearly illustrate the condition of growth of the tree above described. It is a curioaity, hoth as regarda ita appearance and the facta counected with its present condition and growth. We have seen the live-oak—as the California evergreen oak is called—when entirely denuded of all its limhs, and the clean stump left four or six feet high, throw out a perfect profusion of limbs as indicated in our engraving, presenting a rather heautiful appearance; hut we have never observed it where the tree was completely girdled, as in this instance.

We account for it in this wise: The limhs are simply from dormant buds, that, hut for the heading hack of the trunk of the tree, would never have been forced into growth. Its pertinacity in maintaining life is simply owing to the fact, that though the girdling was deeply made in some places, it was not so all around, the depth of the gash heing only 1½ inches, a part of the way. Now, the universally received theory of the motion of sap in trees is this: The sap rises wholly through the alhurnum or sap-wood, as it is called, and after being elahorated hy the leaves—which are the lungs of trees and vegetahles—descends hetween the alhurnum and the liher or inner hark, and forms a concentric ring or layer of new wood upon the preceding year's formation.

The evergreen oak of California has a large proportion of alhurnum or sap-wood, in distinction from the "heart wood;" and if this sap-wood is not entirely cut through in every part, hy the process of girdling, enough ie left to furnish the trunk with sap sufficient, not only to maintain life for two or three years, bnt to cauee a rank growth of foliage, and the more so from the fact that all the sap that does ascend ie kept ahove the girdle, causing a more than ordinary growth there, at the expense of that portion of the trunk helow.

Unless the girdle is grown over—as it sometimes is—in the course of three or four years, the tree usually dies, hardly any species of tree, except the willow and sycamore in some instances, heing ahle longer than that to maintain its vitality, after a deep girdling.

Variation in Animals.

All are familiar with the very important modificatione produced by crossing animals, and most people are aware that methodical eelection may also effect material changee in their characterietics. But the fact that nnconscioue or occasional selection will also eometimes produce most remarkahle results is not eo geuerally known.

One of the most remarkahle resnlts from unconscious eelection ie noticed by Darwin, as having oecurred in Masssachusetts, in 1791, in which an entirely new and permanent breed was suddenly and unexpectedly originated. Tbe record is given as follows: "A lamb wae born having short, crooked lege, and a long back, like a turnepit dog. From this one lamh the *Ancon*, a eemi-monstrous breed, wae produced, most remarkahle for ite power to trausmit its character. Its chief value arose from the fact that the Ancons could be easily enclosed, not being able to leap over even a very low fence. When crossed with other breeds they rarely assumed an intermediate character, their progeny closely resembling one or the other parent. They were also remarkable for keeping by themselvee and apart from other herds. Thie breed hae now, however, become extinct, having been supplanted hy Merinos.

Another instance of uuconscioue selection is found in the Manchamp variety of tbe Merino, which originated from a Merino ram lamb, on the Manchamp farm in France, in 1828, but which was first hrought into special notoriety at the Paris Exposition of 1851. The original ram wae remarkahle for ite very long, straight and eilky wool, very similar to the Cashmere. The animal itself wae aleo quite differeut in shape from the nsual Merino. Iu 1830, M Graux, the then owner of the farm named, ohtained by this ram, one ram and one ewe-lamb, posseseing all the characteristics of the aire. For several subeequent years careful eelection and "vigoroue weeding" wae attended to, nntil qnite a flock was produced. For two or three years the lambs were of two kinde, tbe one producing the curled, elastic wool of the Merino, only a little longer and finer; tbe other like the new hreed. At last, by care and skill, a flock was obtained combining the fine, eilky, fleece, with a emaller head, broader flanks and more capacions cheat than tbe Merino.

A REMARKABLE GROWTH.

The pure Manchamp wool is still songht for in the European market as a most deeirahle combing wool, by reason of its superior strength as well as the length and fineneee of its fiber. It ie employed to mix with the cashmere in the manufacture of shawls and other goods. It commands a price in the French market fully 25 per cent higher than the beet Merino.

Our attention has heen more particularly called to the ahove facts at this time from having been reminded of the very remarkahle fleece to which puhlic attention was called in this State eome two years ago, as having been found in a lot of ordinary wool eent to this city for grading and ehipment. This fleece, if we are not mistaken, presented very mnch the characterietics of the one taken from the animal from which the Manchamp breed was prodnced, and eo much interest wae manifested in it tbat efforts were made to ascertain from what particular locality it was received, with the view, if possible, of identifying the animal which produced it. The inquiry, however, wae unsuccessful. It ie more than probable that the animal which produced it may have been a eport of nature, eimilar to that which resulted, from after care and selection, in the Ancon or Manchamp breede.

These are examplee which California sheep breeders will do well to keep hefore them, as it is now well understood that the natural tendency of the climate of thie State ie to greatly improve the fineness and texture of wool. Indeed thie State poeeessee equal and perhaps greater advantages for the succeesful growth of fine and valuable woole than the lands from whence fine-wooled sheep are imported. It has been stated tbat there is a decided tendency here to eradicate in a great measure the peculiar featuree of ordinary stock, even without the care and attention nsually bestowed in crosebreeding, which etock-growere generally give. When eheep raisere have been hreeding for numbers only, it ia noticed that tbe wool of their flocks hae eteadily improved in quality and quantity, and there ie very little doubt that were proper care and attention given to tbe matter, important and permanent improvements in hreede might be attained, which, if possessed of valuable featuree, ought to be preserved.

In reference to the general laws of variation, tbe late Prof. Rowlandson, of this city, relates a somewhat remarkable case, which occurred some twenty-five years ago upon his own premises, in Ireland. He took from England to his farm in Irelaud, two very handsome Chinese sowe and placed them with a pure, black Neapolitan hoar; the progeny were many-colored, but chiefly a dun color, striped brown down the aidee, and similar to many varieties found native in the islande of tbe Pacific. He kept only a black eow which very much resembled the sire, and proved a remarkably fine animal, poeeessed of very acute inetincte—especially that of smell—in tbie and many other repects resembling the wild rather than the domesticated hog.

MANUFACTURE OF IRON.—The Portland (Oregon) *Bulletin* saye: "A company has been formed for the purpose of manufacturing iron from the ore found at Oewego; work has commenced already; and soon the old furnace will be in full blast. Five teams are engaged in hauling ore from the old Prosser mine in the furnace, and about one hundred men are employed in chopping wood for charcoal, and others are burning it, so that everything in the vicinity has an air of bustling activity to which it has long since been a atranger. The experiments made with thia furnace when it was first erected in 1867 proved that iron of the best quality, equal in fact to any produced in any quarter of the world, could he produced at much less cost thau the same material could he imported from Europe or the Atlantic Statee. Steel made here also had an excellent reputation in all parts of the coast, and was eagerly sought. If judgment is employed, the immense heds of ore in the vicinity of Oswego should he worked to advantage, as the metal yields about 56 per cent. of pure iron equal to the hest Ruasian or Swedish product. This enterprise, if once euccessfully inaugurated, would do much to attract attention to the great mineral resources of Oregon, and to hring capital here to he inveeted."

QUICKSILVER DISCOVERY.—Tbe Sau Bernardino *Guardian* says: A new discovery of quicksilver was recently made hy Mart Thomas and a companion. Tbe lucky discovery wae made by them while hnnting on City Creek, some six milee from tbis place. The mine is situated on the eide of the mountain, ahout a mile or a mile and a-half north of the old mine that wae discovered and somewhat worked a few years ago. It has all heen claimed, and the partiee interested are making arrangements to develop their hidden treasure immediately. Work, on the old mine alluded to, suspended when the ledge ran out, and Mr. Thomas eays he is satisfied it must have heen a slide from the main ledge, which, no douht, ie tbe one discovered lately. A party is to etart out to-morrow to examine it. We bope be will he thonghtful enough to put us down a few feet, if there is an opportunity.

Sonoma County Quicksilver Mines.

The rapid developments in our county in tbe ahove hranch of mining, eaye the Petaluma *Argus*, are attracting the attention of our exchangee and of the capitaliete operating in cinnabar minee, and we venture thie week to describe the location and extent of the minee and their prospecte, as learned from good authority.

The dividing line between Napa and Sonoma counties crossee the foothille of Mt. St. Helena about four miles from Calistoga, and the cinnabar indications first make their appearance here. The dividing line rune acroee the locatione of the Yellow Jacket Quickeilver mine, the larger portion being in Sonoma Co. This mine was discovered in April, 1873, and ie owned by James F. Stuart, Andrew J. Gove and othere in San Francisco. It hae heen worked constantly eince its diecovery, and hae commenced ueing its new furnace thie week. It has been worked slowly and is now on a paying basis, and the indications are favorahle for a very rich deposit. The first shipment of quickeilver in flaske took place on Monday last.

Quicksilver lies in chambere or depoeite, and appeare on the surface only where the opportunity occure for an eecape. By experte this is called a chimuey. An old saying and a true one is "Quicksilver epoute like the whale." Theee eecapee sometimes appear regularly once in every two or three thousand feet, and although often covered by the earth which has elid from tbe higher points, chimneys are eupposed to exist along a well defined ledge of cinnahar-indicating rock at the above mentioned distance apart. The ground located and being actually prospected is about one mile in width, and extends in a westerly direction eome twenty milee, and certainly promieee to he a very valuable tract of land.

Leaving the Yellow Jacket, a mile further westward we come to the Hasbrouck mine, on the ranch of Josiah Hasbrouck, of Knight's Valley. Thie prospect is high up on the mountain, and the metal ehows itself in a eolid facing of black, flinty rock, and eome of it ie exceedingly rich work, and ie being pushed rapidly toward future developments. The Little Beauty is the next location, and the owners are awaiting the resulte of the developments at the Hasbrouck mine before placing a force at work. This claim is owned by tbe ownere of the Yellow Jacket.

The indicatione between thie point and Pine Flat are all located, hut ae no developments of value have been made we will pase them hy for tbe present. Tbe firet location of preseut value after leaving Pine Flat ie the Laet Chance, owned hy W. P. Sutton, of Knight's Valley. Adjoining this is the Thompeon Mine, owned by the Thompson Bros., and here seeme to he the very center of the depoeits. Under tbe able management of Superintendent Clark the mine is developing into a nnmber one investment, and ie now being worked by Gen. Dodge, the San Francisco capitaliet, who hae bonded it for three monthe for a considerahle amount. Ore taken out the past month placee this mine upon the liet ae eecond in the district, and a moderate eetimate will place its ore in sight at very flattering figuree. The General has a etrong bond on that location.

Tbe Rattlesnake mine ie a deposit of native quickeilver, in globulee, in the rock. Oui informant eaw one panful washed, which yielded two pounde of quickeilver. It ie rich heyond deecription. The location ie owned by Meesre. Snow, McKay & Sleeper, who, during the paet week, were offered a hundred thousand dollare for the mine—a good offer for a few monthe' work. A flask, marked for Healdeburg, wae noticed near the tent occupied by the ownere, which they fill from quickeilver extracted by meane of a rocker in a pool of water, no roasting being required. Tbe cut in tbe hillside preeents a wonderful appearance. It is a eoft, gray rock, impregnated with an immense qnantity of theee globnlee, which are easily ehaken into the hand and run together nnperceived. Surely, if thie commencement ie bnt the entrance into a deposit of such metal, the Rattleenake will rank second to no mine on the coast.

Beyond the last-named location, and to the westward, are the Miseonri, Laet Ledge, Geyeer and Kentuck, all promising well. The ore extracted from the minee prospected in thie county ie very rich—the ores from the Yellow Jacket and Thompson's heing eimilar and hearing a marked reeemblance to the Almaden. The oldeet mine which has been eteadily worked is the Pioneer or Bell's mine, near the Geyeer road. Tbis hae heen worked, with paying reeulte, for over seven yeare.

A trip through the cinnabar minee well repaye for the tronhle, and tbey promise to become qnite an attraction for tonriete and mineral hunters.

BANKRUPT.—By ite Secretary, George R. Spiuney, the Mendha Silver Mining Company, of Nevada, has declared iteelf hankrupt. The company has a qnartz mill, reduction worke, and several mines located in the Highland Mining District, Nevada. The value of the mining property is repreeented by a cypher in the petition; hut the mill site is etated to be worth $20,000, and two eprings are valued at $50 each. Under the head of pereonal property the aesets are valued at $17,500. The debts so far ascertained amount to $80,000; bnt the Secretary avers that it ie impossihle to preeent the debi and credit halancee accurately in the meantime.

Useful Information.

Watering House Plants.

The English *Garden* is inclined to dispute the rule that water "should be given in moderately small quantities, and supplied frequently." If the causes of failure where plants are cultivated in windows were minutely investigated, the dribbling system of watering would be found to be the principal cause. A plant ought not to be watered until it is in a fit condition to receive a liberal supply of that element, having previously secured a good drainage, in order that all superabundant water may be quickly carried off. Those who are constantly dribbling a moderately small quantity of water upon their plants will not have them in a flourishing condition for any length of time. This must be obvious to all, for it is quite evident that the moderately small quantities of water frequently given would keep the surface of the soil moist, while at the same time from the effects of good drainage, which is essential to the well being of all plants in an artificial state, all the lower roots would perish for want of water, and the plant would become sickly and eventually die.

Brown Paint for Iron and Steel.—The following mixture forms an excellent brown coating for protecting iron and steel from rust. Dissolve two parts crystallized chloride of iron, two parts chloride of antimony, and one part tannin, in four parts water, apply with a sponge or rag, and let dry. Then another coat of the paint is applied, and again another, if necessary, until the color becomes as dark as desired. When dry, it is washed with water, allowed to dry again, and the surface polished with boiled linseed oil. The chloride of antimony must be as nearly neutral as possible.

A method of producing gum from the milkweed plant, and flax and other seeds, has been suggested. It consists in macerating and fermenting the substances, and then by evaporation reducing the resulting liquid to a thick, gummy mass. The gum thus obtained may be cheaply produced, and it is alleged to have many of the valuable qualities of rubber. It is insoluble in water, may be vulcanized with sulphur, etc. The price of pure rubber is now very high, and the discovery of an economical substitute is a matter of the greatest importance in the arts.

Oil from Hen's Eggs.—The healing properties in the new oil extracted from hen's eggs are said to be very great, and it can be easily made. First, the eggs are boiled hard; the yolks are removed, crushed and placed over a fire, where they are carefully stirred, and when the substance is just on the eve of catching fire, the oil separates, and may be poured off. One yolk will yield nearly two teaspoonfuls of oil. In the southern parts of Russia it is much used for curing cuts and bruises.

Washing Fluid.—Three tablespoonfuls soda, the same quantity of dissolved camphor (the same as kept for family use), to a quart of soft water; bottle it up, and shake it well before using. For a large washing, take four tablespoonfuls of the fluid to a pint of soap, make a warm suds and soak the clothes half an hour; then make another suds, using the same quantity of soap and fluid, and boil them just fifteen minutes, then rinse in two waters.

Red Brandy Ink.—The following recipe is from the *Druggists' Circular:* Cochineal, pulverized fine; cream of tartar; of each 2 oz. Mix, and add boiling water, 8 oz. Let stand for 15 minutes, then neutralize by adding carbonate of potash, one ounce. After the neutralization, add alum (powdered), gum arabic (powdered), of each, 1 oz.; starch 2 oz. Mix.

To remove iron mould in linen, wash the spots in a strong solution of cream of tartar and water. Repeat if necessary, and dry in the sun. Another method: Rub the spots with a little powdered oxalic acid or salts of lemon and warm water. Let it remain a few minutes and then rinse in clean water.

To Make Wall Paper Stick.—Make a pasto of flour same as you do for starch; do not let it boil. When cold apply to the paper with a brush, not having it so thick but that it will spread evenly over the surface, or so thin as to wet the paper through. Cheap paper is not so cheap at last as a little better paper.

Artificial Ivory.—Two pounds of pure India rubber are dissolved in thirty-two pounds of chloroform and the solution saturated with purified ammoniacal gas. The chloroform is then evaporated or distilled off at a temperature of 185° Fahr. The residue is mixed with pulverized phosphate of lime or carbonate of zinc, pressed into molds and cooled. When the phosphate of lime is used, the resulting compound partakes in a great degree of the nature and composition of genuine ivory, for we have the requisite proportion of the phosphate, and the India rubber, which takes the place of the cartilage; and the other component parts of the genuine article of little importance.—*Scientific American.*

To Preserve Clothes Pins.—They should be boiled a few moments and quickly dried, once or twice a month, when they become more flexible and durable. Clothes lines will last longer and keep in better order for wash-day service, if occasionally treated in the same manner.

Good Health.

The Health of Farmers.

The following true words from the *Science of Health* should be inscribed in letters of gold over every farmer's fireside: —"Farmers have unequaled natural advantages for health, strength and longevity. The statistics of disease and the tables of mortality, however, are against them. This is due not to their vocation, but to their misuse of it. No class, as a whole, is probably so utterly reckless of health conditions. So far as our acquaintance with the habits of farmers is concerned—and it has been extensive—it compels the conclusion, as a rule, that the dietetic habits of farmers are worse than those of any other class who have the means of choosing for themselves. Fried dishes several times a day, with several fried articles at each of the three meals, is one of their common abominations; dried beef, old cheese and pickles are among the common relishes, while lard and saleratus make their richer dainties indigestible and caustic. We have seen on a farmer's table, fried pork, fried eggs, fried potatoes and fried griddle cakes, for breakfast; fried ham, fried bominy and fried parsnips for dinner, and fried sausages and fried doughnuts for supper—all the frying done in lard. No class is so troubled with canker, erysipelas, tumors, cancers and bumors, as farmers; and the excessive use of pork, lard, fine flour, rich cakes and greasy pastry, is enough to account for it. In dietetic habits, our farmers are sadly misled by the agricultural journals, nearly all of which pander to their prejudices, and flatter their morbid appetites by recommending and commending swine breeding and pork eating, while they fill their kitchen column with receipts for making 'rich and palatable' puddings, pies, cakes and other complicated dishes, which no stomach ever carried inside a human body could long tolerate without death or dyspepsia. The essential need of our farmers is plain, wholesome food, properly cooked. This would give them much more available strength for work, relieve them of many of the distresses and expenses of sickness, add many years to their lives, and render old age 'green' and normal, instead of dry and decrepit, as it is in most cases under existing habits."

Sleep.

There is no fact more clearly established in the physiology of man than this, that the brain expends its energies and itself during the hours of wakefulness, and that these are recuperated during sleep; if the recuperation does not equal the expenditure, the brain withers—this is insanity. Thus it is that, in early English history, persons who were condemned to death by being prevented from sleeping, always died raving maniacs; thus it is, also, that those who are starved to death become insane; the brain is not nourished, and they cannot sleep. The practical inferences are these:—

First.—Those who think most, who do most brain work, require most sleep.

Second.—That time saved from necessary sleep is infallibly destructive to mind, body, and estate.

Third.—Give yourself, your children, your servants—give all that are under you, the fullest amount of sleep they will take, compelling them to retire at some regular hour, and to arise the moment they wake; and within a fortnight, nature, with almost the regularity of the sun, will unloose the bands of sleep the moment enough repose has been secured for the wants of the system. This is the only safe and sufficient rule; and as to the question how much sleep any one requires, each one must be a rule for himself. Nature will never fail to write it out to the observer under the regulations just given.—*Ex.*

How to Treat the Bite of a Mad Dog.

Dr. Stephen Ware of Boston, in his testimony in a recent case which grew out of the injuries from the bite of a dog, furnished the following valuable advice: In the case of the bite of a dog, where the teeth of the animal penetrated the flesh, whether the dog was known to be mad or not, he should use the same precautions. He would wash the wound with warm water, extract all the virus possible by sucking the wound with his lips, and then cauterize it deeply with the caustic most readily obtained; but should use potash if it could be procured at once. The time in which the effects of the bite of a mad dog would be seen varied from two to three days to as many years, but if no effects were felt after two or three months, as a general thing, the patient might consider himself safe. Bites made through clothing are seldom productive of much harm, as even if the dog is mad the clothing absorbs the virus before the teeth reach the flesh. Most of all the fatal cases are where the person was bitten on some naked spot. —*Ex.*

We can bear personal testimony to the truth of the closing portion of the above paragraph; for, when a child, it chanced to be our lot to be picked up by a mad hog, and so severely shaken that the prints of the animal's teeth were left upon our person so deeply indented as to cause a free effusion of blood. The virus was evidently removed from the teeth by the clothing with which we were covered. At least, a lapse of about fifty years has never shown any unpleasant consequences from the encounter, unless we except certain very infrequent occasions on which our blood has been badly stirred by the annoying visits of our "devil" for "copy" or the delinquency of subscribers.

Oat Meal in Drinks.

This is highly recommended by those who have tested it. One writer says: "Last Summer we attended a field trial of plows, and for a drink in the field we had buckets of cold water with oat meal stirred in, which we found to be both victuals and drink, and mighty refreshing." A Scottish medical journal also says of oat meal that in its raw state, when mixed with water, it is becoming a favorite dish. The brose of "Auld Scotland" is becoming a favorite dish—and we are glad to note this, because we believe it to be a healthy and muscle-forming commodity—by the hunters and trappers of the West who are substituting oat meal in this form for parched Indian corn. The same brawny fellows—whose powers of endurance are proverbial, whose scorn of fatigue is known to all readers of natural history—have found out that a very acceptable drink is made by putting about two teaspoonfuls of oat meal to a tumbler of water. This they—the hunters and trappers—aver to be the best drink they can use, and it is at once nourishing, unstimulating and satisfying.

Sunstroke — Its Prevention and Cure.—The following article was sent by a correspondent to the New York *Tribune:* "The true preventive of sunstroke will be found in the copious use of cold water, as it is also the best restorative after a sunstroke has occured. This sad affliction for humanity, so common every year in New York, is simply the fruit of carelessness. It is needless that it should occur. Take a handkerchief, dip it in cold water and wring it out. This placed in the crown of the hat, and its moisture renewed from time to time, will be found an effectual protection. A sponge would answer equally well, and would keep moist longer. Persons necessarily exposed to the rays of the sun in summer should drink a glass of water from time to time, and also bathe the hands and face in cold water. Were these directions generally followed, sunstrokes would be almost unknown."

Perpetual Paste.—The *Journal of Applied Chemistry* says: Dissolve a teaspoonful of alum in a quart of warm water. When cold, stir in as much flour as will give it the consistency of thick cream, being particular to break up all the lumps: stir in as much powdered rosin as will lie on a dime, and throw in half a dozen cloves to give a pleasant odor. Have on the fire a teacup of boiling water; pour the flour mixture into it, stirring well at the time. In a very few minutes it will be of the consistency of mush. Pour in into an earthen or china vessel; let it cool; lay a cover on, and put it in a cool place. When needed for use, take out a portion and soften it with warm water. Paste thus made will last twelve months.

Domestic Economy.

Succotash.—Sweet corn and Lima beans make the epicure's succotash, but string-beans are commonly used. Strip off the husks and silk from a dozen ears of sweet corn, and cut the grains off the cobs. If the corn is not very tender, chop as for green corn pudding. String a quart of green beans, and chop them into half-inch lengths. Put the corn and beans together into a quart of cold water or milk, cover them close, and boil gently until done. Usual time, three-quarters of an hour, but it is safest to test them. A few minutes before taking off the fire, add a teacupful of table butter, and salt and pepper to taste. Stir well together, let it boil up, then take the succotash out in a dish with as much of the liquid as may be desired. In place of butter, half a pound of nice corned fat pork may be boiled with the beans and corn. The pork should be first cut in very thin slices, and no additional salt will be required.—*Hearth and Home.*

To Can Fruit.—In the *Michigan Farmer* Mrs. Competent thus gives her process of canning: "While the fruit is being scalded put a gill or more of warm water in each can and fill up with hot; putting the rubbers and covers into hot water also. The fruit need not be cooked all to a mush or jam, but must be thoroughly scalded through. When sufficiently boiled, empty a can and fill—then another and another; a half dozen may be filled at once. Leave the can open a few moments, and the fruit will settle, leaving a space unfilled at the top. Cut thick writing paper in round pieces the size of the top of each can; slip one over the top of the fruit in each jar, and fill up with boiling juice reserved for the purpose, and put on the rubbers and covers and screw down at once.'

Unfailing Sponge-Cake.—Weigh one pound of fresh eggs in the shell, an equal weight of pulverized white sugar, half a pound of fine flour. Break the eggs, and beat separately the yolks and whites. We always, when practicable, have one person beat the yolks steadily the same length of time it takes another person to beat the whites until they stand up perfectly stiff and dry. Add the sifted sugar gradually to the yolks, then mix in the whites. Lastly, cream gently in the flour, and be sure not to beat at all afterward, or you will certainly spoil the cake. Grate in the peel of one lemon, and add also its strained juice; more, if the fruit is indifferent. Lemons are incomparably to be preferred as the seasoning for sponge-cake, but if they are not to be obtained, substitute mace.

Mixed Pickle.—One and one-half gallons of cabbage, 1¼ gallons cucumbers; 1 gallon green tomatoes; 1 gallon onions; 3 quarts green peppers chopped fine and pressed hard to extract the water. Before measuring, mix and put in a bag over night; next morning squeeze and press all the water that can be gotten from it, then prepare the seasoning; 1½ cups of ginger; 1½ cups black pepper; 1 quart white mustard seed; 1 pint grated horseradish; 1 tablespoonful cloves; 2 ounces celery seed; 4 grated nutmegs; mix together and then mix through the pickle. Take 3 gallons of apple vinegar, add 5 pounds of sugar, boil and pour over the mixture. Salt to taste.

A Nice Cake.—Take two cups of flour, one cup of sugar, two eggs, two-thirds of a cup of butter, one teaspoonful of acid, half a teaspoonful of soda (Horsford's Bread Preparation), half a cup of milk, one teaspoonful extract of lemon. Bake on Washington pie plates. Very nice.—*Massachusetts Ploughman.*

Ginger Cookies.—One cup of molasses, one-half cup of sugar, two-thirds cup of butter, one-half cup of water, one egg, two teaspoonfuls of saleratus, one-half teaspoonful of alum, one teaspoonful of ginger, flour enough to roll out soft. Bake quick.

Egg Plant.—Pare the fruit, cut it into slices a third of an inch thick, slightly salt the pieces and stack them upon a plate. In an hour or two they will have lost considerable water. They are then to be dipped in beaten egg, sprinkled with cracker crumbs and fried. Serve very hot.

Grapes for Winter Use.—Take ripe grapes, pick off from stems, wash if not perfectly clean, place in jar and cover with molasses. After two or three days seal over and tie them up tightly. For mince pies and seasoning in winter, they are delicious.

MINING AND SCIENTIFIC PRESS.

THE SAN FRANCISCO FISH MARKETS.—Drs. Finsch and Linderman, of Bremen, who visited this Coast about a year ago, to examine into the condition and prospecte of the Pacific Coast fisheries, state, in their official report to the German Minister of Agriculture, that the cleanly and attractive manner in which fish are kept for sale in the mark ets of this city is worthy of the highest praise. They, however, see no present probability of the establishment here of extensive fisheries to compete with those of Northern Europe — and this although there is no lack of fish in the Pacific Coast waters.

THE MEXICAN GOVERNMENT has passed liberal laws to promote the mining interest, but the revenue officers are said to be continually embarrassing the execution of these lawe. One of these embarrassements is the prohibition to export ores when crushed or concentrated, and petitione from various mining districts are now before the Executive to have thie important point settled.

BOSTON FIRES — THE HUB. — A Baltimore gentleman, writing from Boston, accounte for the frequency of great fires in that city as folowe: "In the rapid whirl of events, the motion of the universe becoming accelerated, 'the hub' is evidently over-heated by friction; hence the nnmerous conflagrations." It may be aleo of interest to note that the said correspondent wae a clergyman.

THE Yale Scientific party with Profeesor Mareh, have left Salt Lake City, some of them coming here, and some going to Qregon. They will remain on this coast abont one mouth, and have already made eome interesting diecoveriee.

THE Rye Patch Mill shipped $2,500 on the 8th.

The U. P. R. R. Co. sold over 20,000 acree of land during July at an average price of $6.73 per acre.

Concentration of Ores.

The failure iu the past of a majority of the improved "Reduction processes," based upon a uee of chemical reageuts, which eeemed to promise good resnlts iu the working of "rebellious" ores, has disconraged capitalists from invcsting iu that very numeroue branch of mines, and has caused busineee men to lose their iuteresr in mining ae an industrial pursnit promising good returne. While in many cases theee ores are worked at the mine, yet after yeare of costly experimcnt the balance-sheet of profit and loss in the treatmeut of low grade and rebellious ores too often shows the balance on the wrong side of the acconnt, and the general public are apt to say "mining is played out." Yet there is not a thoughtful, well informed man in our community who doee not realize that the vast metallic wealth of gold, silver, copper and lead, of the Pacific Coast is as yet hardly touched by the miner'e pick, and that a commorcial proeperity based upon the production of bullion awaits ue iu the future. We have low grade mines innumerable, holding vast treasures, awaiting only some cheap process of extraction of the metallic values from the barren gangue. The questiou is before ue cbntinually, How can we make

These Base Metal Mines Profitable

which, though large in extent, have resietcd all attempts to make the mining of them pecuniarily profitable. We fully realize what vast amounts of hase metal and low grade ores are awaiting a process which will pay the miner a profit for his work, thereby not only benefitiug himself and hie locality but stimulating trade in all the great businees centers. We have watched with great interest the various inventions proposed and one method in particular seems destined to do much towards the desired end. That is concentration—the separatiou at the miues, of the metallic ore from the worthless gangue. This method avoids the reduction treatment or shipment of a large amount of worthless stuff, and concentrates the metallic value of ten, fiftcen or twenty tone of "rock" into one ton of pure metallic ore which can then be shipped to a market as a farmer ships his grain after separating it from the straw or chaff, Or it cau be treated in a reverberatory furnace, by chlorination, or if accompauied by sufficient lead, can he smelted. The qneetion of fuel will determine whether it ie cheaper to reduce or ship at certein localities. In a district embracing a nnmber of mines, a large concentration mill could do custom work for a number of small mines.

Air or Water to be Used.

Several forms of shaking tablee and jigging apparatus, each of which have reepective merite and which operate with water ae the separating agent, are in uee with more or lese efficacy upon a certain class of oree; but from the neceseity of employing water in their operatione their use must always be limited by the circnm stances of locality and season on thie coast. The great desideratum, therefore, seeme to be a simple, efficient ore concentrator, employing air instead of water ae the eeparating medium. The advantagee of air machinee over water are that they avoid, first, the great loee of the lighter sulphurets, which are carried off to a great extent by the water flow; secondly, the limited amount of ore subject to daily treatment by water jigs; thirdly, the absence of water in many localities rendering a large class of ores worthless from want ot concentrstion, while in a dry concentrator the supply of air being unlimited, concentration ie practicable in any locality at all seasons.

From the nature of the industrial law which always fnrnishes a remedy or snpply for every pressing need or demand, we have heen awaiting the invention of a concentrator, ueing air as the separating medinm, which ehonld be simple in construction, easily and cheaply operated, and with such rapidity of work and accuracy of separation ae to render the concentration of all classes of rebellious and low grade ore profitable. From the working resulte of a

Dry Ore Concentrator now in Operation

on a large scale in Star City, Nevada, it seeme as though the necessitiee of the mining commnnity were at last met. The invention is that of S. R. Krom, and is very simple in construction and operation, the principle upon which it accomplishes its results being that of the agitation of the cruehed ore by jete or puffs of air rapidly applied, by which, from the difference in specific gravity of the metallic portione and the rocky or earthy gangue, the heavier or metallic particles gravitate to the bottom of the ore-bed and are discharged by appropriate means, while the lighter gangue ie agitated (not merely blown) by the air-puffs to the top, and thrown off as waste or tailinge. One of these machinee is now to be seen at No. 105 First St., and on inquiry we learn that the following results have been accomplished in Star Cañon, Humboldt Co., Nev.

The mill ie a complete one, with Krom'e patent eteel crushing rolls and nine concentratore. Work wae hegun in the latter part of March, of this year, on ore from the De Soto mine. The ore contained about 3 to 5 per cent. of baee metal, principally antimony with zinc and lead, carrying $54.56 iu silver, in the form of black sulphuret. It would not amalgamate and wae too poor to work there, nor would it bear ehipment, beiug of eo low a grade, so it wae practicelly worthless. Water concentration was tried, but a large proportion of the sulphnrets were lost and the balance wonld not pay. The treatment by the Krom dry ore eeparating machinery gave the following results:

Assay value of orignal ore, per ton, before concentration	$54.56
Assay value of concentration of 25 to 30 tons (according to percentage of metal) into one ton by the Krom machines, per ton:	
Coarse sizing	1,200 00
Medium sizing	1,500 00
Fine sizing	1,662 00
Tailings, per ton (assay value)	$3 23 to 3 53

That is to say, the metsllic value of every twenty-five to thirty tous of ore (dependent npon the percentage of metallic ore coutained in the mass) was separated from the barren gangue and placed or concentrated into one ton of pnre metallic ore, while twenty-four to twenty-nine tons of barren gangue rock were thrown aside by the machine ae tailings, these tailinge containing the small percentage of $3.23 per tou, while the concentrated metallic portion contained respectively the value of $1,200, $1,500, end $1,662 per ton.

The cost of thns separating the valuable from the valueles ie less than $5 per ton on the gross number of tons. This cost ($5) includes royalty to inventor. The power required for the eeparating machinee is merely nominal, as one horse power operates eight of the machines, each of which separates a half-ton crushed ore per hour. The cost, therefore, ie principally iu the crushing of the ore. This ore was shipped to this city. Some two car loads of concentrations from other mines in the district arrived here a few daye since. This De Soto ore which at $54 in its natural etate, wae worthless, hy concentration was made to yield a profit of over $30 per ton above expenses of concentration and ehipment. The following satisfactory

Exhibit of Actual Working

Of the mill producing these concentrations ie given:

GROSS.

30 tons of ore, assay value $54.00 per ton, is worth	$1,620.00
Deduct loss of $3.23 per ton, 29 tons tailings...	93.67
Net value of concentrations from 30 tons of ore,	$1,526.33

EXPENSES.

Cost of concentration, or separation of 30 tons into one at $5.00 per ton	$150.00
Deduct 8 per cent. from assay value, 92 per cent. of the value heing received for the concentrations	122.08
Cost of shipment of ono ton of concentrated ore to Germany	75.00
Total cost of concentration and shipment	$347.08
Assay value of concentrations from 30 tons of ore	$1,526.33
Expenses of concentration and snipment and discount from assay value	347.08
Net returns from 30 tons of ore concentrated into one ton by the Krom machines	$1,179.25

Estimate the treatment of 40 tons daily (the full capacity of the Star Cañon Mill) of the clase or character of oree as above described and of similar value, and which hitherto have been utterly valueleee (and immenee quantitiee are everywhere found in the mining regions), no treatment whatever hitherto being of any avail, and we have a striking exhibit of absolute profits on hitherto worthless oree, which mnst claim the attention of every capitalist, mine-owner, and businese man, who is in the least intereeted in the bneinese prosperity of the Pacific Coaet.

Ae the mill referred to is now in daily operation in Star Cañon, working from 30 to 40 tone daily, the etatemente made can easily be verified by those interested. Mr. J. R. Nichols, formerly of the U. P. R. R., ie now engaged in putting np extensive concentrating worke in Salt Lake City, in which this process is to be nsed. The works will have a capacity of 50 tons per day.

The Figures Given

Are very encouraging, when we consider the vast amount of low grade ores capable of being made to yield bullion and add so immeneely to our commercial proeperity, the subject is certainly worthy of investigation, eepecially as it is asserted that the statemente given are not mere theoretical promises, but practical facts, based upon actual operations, on a large scale, continued for five months past at Star Cañon. The mill is run as a custom mill and is said to be etimulating mining and prospecting greatly, in that and adjoining districts. The minere now take a few tons of their low grade ores, haul them to the mill for concentration and realize immediately on the shipment of their concentrated ore, which is readily saleable, being of a high grade. They thue obtain ready capital for further development, without sacrificing their claims to capitalists for the necessities of life.

It will be seen at a glance that this method of

Disposing of these Low-Grade Ores

Will be facilitated by the erection of concentrating mills, similar to the one in operation in Star Cañon, in many districte. We have thoueands of mines at present worthless, not yielding a ton of ore, which, if a concentrating mill wae erected near by, would be worked by the miners themeelvee, ae they would be more independent of capital, relying on their own strong arms and energetic industry for the development of their claime. The concentrating mill of their district, working or pnrchasiug their ores, and thus yielding immediately a return for their labor, wonld benefit thie claee of men, and they would not be compelled to "prospect for grub," or aek favore of capitaliste.

Tho subject of the concentration of ores ie one of vital importance to all of ue on thie Coast, for onr low-grade ores, if worked, will sdd eo much to our prosperity. If the minere of eech district are afforded an opportnnity to concentrate their individual oree into that condition of metallic purity or freedom from worthlees gangue by which their ehipment ie renderod profitable, it is equivalent to the diecovery of just so many mines of high-grade ores. If we had a thousand or two minee on this Coast, each of them turning out from five to twenty tons of $300 or $1,000-ore daily, "dull times" would disappear immediately. If the many low-grade mines now idle were all at work, and the ore concentrated profitably in a proportion of ten or twenty tons of "rock" to one of metallic concentration, it ie eqnal to just so much high-grade ore from rich minee. The system of dry concentration now in operation in Star Cañon, claime to be able to produce thie much desired reeult in every locality and on all kinde of oree, the procese being a mechanical and not a chemical one, so there are not the contingencies of varying chemical combinations to interfere with its operatione. All that is needed ie a difference of one per cent. of specific gravity in metal and gangne, and a eupply of crushed ore. Natnre furniehes the separating medium—air—with equal bounty in the valley or on the monntain top, in winter or eummer. Water righte of course would amonnt to nothing, and no monopoly hae yet got hold of all the air. We have been shown epecimene of rock and concentratione worked by this machine, which attest ite capacity. Ite working is perfectly eimple, and we adviee onr mining friende to go and see it in operation. We shall endeavor to obtain euitable engravinge aud describe it to distant readere.

The State Fair.

This Fair, which will open on the 15th, and continue till the 20th inet., promises to be well attended, and our various producing intereste are expected to be fully represented. Among the inducements offered to farmers to send in their products for exhibition and competition, is the arrangement with the railroad and branches to have freight forwarded free for exhibition purpoees. Rates of fare will aleo be reduced one-half.

We learn that active preparations are being made. It is to be hoped that the Fair will be the success it should be rendered. To accomplish this result, it rests with the farmers of the State to furnish specimens of their choicest fruit, vegetables, etock, etc., and without their earnest efforts, to further the objects to be obtained by such comparieon and trial, the result will be unsatisfactory. Let the Fair be truly representative of the State.

THE first car load of bullion of 11 tons wae brought into Salt Lake thie week, from the Chicago Smelter at Rush Valley. It wae from the Chicago mine which wae recently eold to English capitalists.

RECENT developments at the Gooee Creek Mining District, twenty milee from Tecoma, on the Central Pacific Railroad, are said to be of a most extraordinary character, and are attracting much attention from mining men.

A GOLD mine in Australia, developed within the past year, recently had a cruehing of 53 tone of ore, which yielded $2,000 per ton. Why can't eome of onr proepectore here find one like it?

THE EUREKA Coneolidated Mining Co. have put in operation a diamond drill run by eteam, to prospect the mine. A number of boree are to be made, the cores being taken out and aseayed.

THE iron ore found at Butte creek, near Chico, can be laid down at the depot at Chico for $5 per ton. The *Record* eaye it yielde 80 per cent.

THE coal diecoveries in the weetern part of Amador county are looking well as far as prospected.

THREE men, in five days, dug ont $1,250 on Myrtle Creek, Cnrry county, Oregon, recently.

THE Raymond & Ely mine hae again etarted work, the injnnction on it having been raieed.

THE Placer gold from the Steetkin river ie worth $18 an ounce.

EUREKA shipped 2,432,592 pounde of bullion in Auguet.

The Panamint Mines.

A friend who returned this week from a trip to the Panamint mines furnishes us with some information concerning the new district which is of interest. The mines are in Inyo county, in this State, on the southeastern edge of the county, on the western flank of Telescope Peak, Panamint mountains. They lie on each side of a cañon running due west from the Peak, and at an altitude above the sea of about 6,000 feet. The cañon in which the mines are situated is about nine or ten miles long, and terminates in the Panamint Valley. From sixteen to twenty inches of water are now running down the cañon at the driest part of the year. There is at the mines an abundance of piñon wood for fuel, but none fit for making lumber. The route from this city to the mines is by railroad to Tulare or Tipton; then by stage *via* Kern River to Kernville and Walker's Pass, and across the mountains by stags to Owen's Little Lake. From Owen's Little Lake there are sixty miles horse-back riding to the mines, which lie directly east of Walker's Pass about one hundred miles.

As yet there are only about twenty men in the district, all practical miners and claim-holders. As the camp is quite young, very little work has been done, and developments are being made slowly. The formation is limestone. Some of the leads are described as cropping out from a quarter of a mile to two miles in length, and run from a "knife-blade" up to thirty feet in width. The surface of the country is such that some of the ledges are cut in places by deep cañons showing the veins from 200 to 300 feet below the croppings on the hills. One of the ledges—the Wonder of the World—shows croppings thirty feet in width, and, where a cañon has cross-cut it on the east side, 300 feet below, it is still the same width. The miners can run right in on the ledges with tunnels, in several instances, and while working on the vein all the time, will get under "grass roots" several hundred feet.

About one hundred claims have been recorded and a town site has been located. The characteristic ores of the district are a silver copper glance. Our informant showed us a number of specimens of different kinds of ore, most of which was argentiferous galena, though there were some chloride ores and a few pieces containing an abundance of native silver. The ores assay all the way between $50 and $250, some selected specimens running much higher. The expense of getting to these mines from this city is about $75. The climate there is good, but very warm weather may be experienced on the road, which is said to be a rough one. The country is perfectly wild and unsettled, with no game, however, except a few mountain sheep; but there is plenty of bunch grass for food for horses, etc.

Teamsters offer to haul freight from Panamint Valley to Los Angeles for three cents per pound, but at present it will cost from 3 to 5 cents. Machinery and everything will have to be packed on horses or mules for seven miles up the cañon, unless a wagon road is built. It is about the same distance to haul from Tipton as from Los Angeles, the only difference in freight being that charged to Los Angeles by water and Tipton by rail. It is expected that a mill will be put up in the district within a few months, but it will be a light one, made in sections for convenience in packing. Some of the ores will work by mill process, others again will necessitate the use of furnaces: there is plenty of fuel for the latter purpose. The men now in the district are staking out their claims, putting up boundaries, and doing some little work on their locations. All the claims taken up have been located under the new mining law, which gives 1500 feet in length and 150 feet on each side of the vein. The miners have taken every precaution to prevent future litigation, by being particular in their measurements and boundaries. Our informant thinks the mines are undoubtedly rich and valuable, but they will, like most others, require the aid of capital to develop them. The men now in the district are doing the necessary work to hold their claims, and hope for custom mills or furnaces, unless they can get capitalists to turn their attention that way.

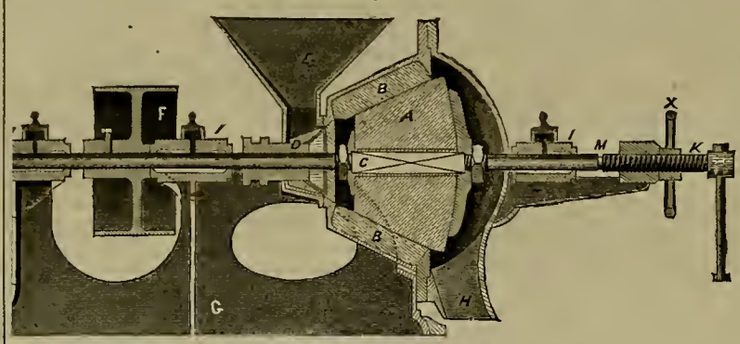
The Cornucopia mines are going to ship a quantity of ore to be tested by mill process. Dispatches from there deny that any Vigilance Committee has been formed, and there is little trouble from jumpers. There is a rumor that there will be a mill erected there soon, as is usually the case in all new camps. Miners are still going to the camp, though some are leaving.

Quicksilver is reported by dispatches from New York as having gone up to $1.12 a pound in gold.

Ross' Horizontal Mill.

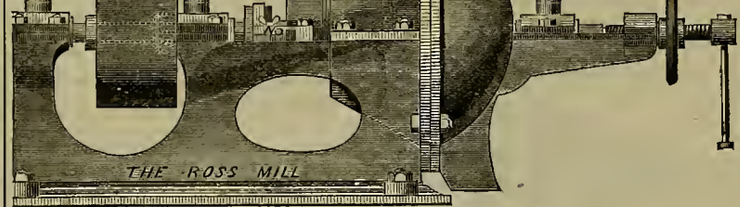
The accompanying engravings represent the horizontal grain mill, manufactured by Ross Brothers, Williamsburgh, N. Y. Figure 1 is a sectional view of the mill, and figure 2 the elevation. The manner of working is easily seen. *A* and *B* are French burr stones, *A* being set on a horizontal shaft, which rests on the bearings, *I, I, I*, and which may be regulated to counteract the effects of wear by the set-screw, *K*. The grain is fed into the hopper and passes through the passage, *D*, between the revolving stone, *A*, and the bed stones, *B, B*, and is discharged through the opening, *H*. The whole apparatus is made on a stationary bed-plate or frame, *G*. The rotary motion is given by the pulley, *F*.

In all the improvements in mills, with patent feeds, patent balances, patent brushes, etc., it seems the stone remains the same and is pre-eminent for grinding purposes. It is an old saying "there is nothing like leather," but the



SECTIONAL VIEW OF THE ROSS' MILL. FIG. 1

makers of this mill say when it is a question of grinding, there is nothing like the French burrstones and on this principle is this compact machine built. The bed stone *B*, is a concave surface of stone, fixed in a cast iron frame; the runner *A*, being a cone firmly secured to the spindle, the two surfaces being



ELEVATION OF THE ROSS MILL. FIG. 2.

fitted and faced to preserve a perfect uniformity or evenness in grinding,

The mills are made of various sizes and styles to suit every variety of business on a large or small scale. They grind grain, printers' ink, ivory black, coach colors, white lead and paints of all kinds, as well as drugs, spices, coffee and similar substances. The flour made by the mill is ground cool and dry and is said to keep sweet and sound indefinitely. There is an anxiliary mill made to grind middlings, which it is claimed will grind closer than any first mill can do. The horizontal mill is made to facilitate feeding, as grain and other substances feed well in this manner. The vertical mills are mainly used for grinding paint and other oily mixtures which press right down into the mill. They are on the same principle, the position of the stones only being reversed. The manufacturers claim that in fitting up any grinding establishment, fifty per cent. of cost and a large per cent. of running expenses may be saved by the use of this mill as it saves considerable power and grinds fine and fast. The price of a plain pulley mill without gears as stated in the manufacturers' circular are, for No. 1, $100; No. 2, $175; and for No. 4, $300. With gears they cost about $30 more. Mixers with Nos. 2 or 4, cost $30.

A company has been organized to work a hydraulic claim, near the head waters of the Santa Ana River, on the San Bernardino mountains.

The Lincoln Mine Disaster.

On the 5th instant a terrible disaster occurred in the Lincoln Mine at Sutter Creek, by which nine men lost their lives. The cause of the accident is thus stated in brief: The mine changed owners last winter, and the present Superintendent, S. D. R. Stewart, was told that the old shaft was but 270 feet in depth. They were running their level from the new shaft at a depth of 340 feet. The top of the old shaft is 27 feet lower than the new. Depending on their survey and the correctness of their information in regard to the depth of the old shaft, they supposed that they were running at least thirty feet below it and consequently did not take the same precautions to guard against accidents in approaching it that they would have done if they had been correctly informed as to its depth, which was something over three hundred feet. The mine had been closed since 1860. The *Independent*, the local paper, says that the morning shift had been lowered, and some were working on the 300 foot and others on the 500 and 600-foot levels. The two on the 300-foot level were drifting south and were expecting to strike into the old south shaft in about twenty or thirty feet, but found the air rather foul and became fearful that they were nearer the shaft than they anticipated. They kept on, however, and suddenly struck through, when a volume of foul air rushed in that drove them rapidly to the main shaft. The signal was sounded, but they could not be rescued in time. They then climbed the timbers about sixty feet, before the bucket was lowered. Mr. Horn, foreman, and another gentleman went down, and succeeded in getting the two men into the bucket, and on reaching the top they were like dead men from suffocation. Medical aid was at once summoned, and everything possible was done for the victim.

Superintendent Stewart was on hand, and, with the aid of Foreman Horn, did everything that human power could to reach the men on the two lower levels, but it was impossible to get within fifty feet of the 300-foot level. No lights would burn and the men came near suffocating. The water buckets were rapidly let down and raised, but no sign of the poor men below could be seen or heard. Twelve good men were dying, yet those above could do nothing. Six of the men were working on the 500 and six on the 600-foot level. Every effort was made to get the bad air out and rescue the men, but for some time without avail. At about 10 o'clock, on the night after the disaster, while the men were busy hoisting water from the mine so as to reduce its volume, in order to reach the lower level and search for the men, a bell was rung from below. On hoisting the bucket, a man came up with it, shouting as he came "I am all right, there are three more men alive down there!" The news soon spread and, as soon as possible, Mr. Horn, of the Lincoln mine, and Mr. Jones, of the Amador, went down the shaft and sent the three men up.

These men were in a living grave for 36 hours. Their graves had been dug, coffins made, grave clothes prepared and their friends mourned them as dead. They explain their miraculous escape as follows: At the time of making the opening into the old mine in the 300-foot level, from which rushed the foul air and water, six men were working on an *incline* in the 500-foot level, and the flow of water was so sudden that it filled the mouth or entrance of the level and thus shut out the deadly gas and prevented it from reaching them. They were literally buried alive, and the survivors remained in their living tomb for thirty-six hours. Before the water was lowered two of the men were drowned, in efforts to reach the shaft. Nine lives were lost by the disaster; seven by foul air and two by drowning.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., September 9th, 1873.

For Week Ending August 26th, 1873.*

Cobble-Stone Facing Machine.—Louis Dutertre, S. F., Cal.

Harness Attachment.—Engene Croughwell, Augustus Tillman and Edward L. Vanderberg, S. F., Cal.

Hydraulic Motor. — Wm. Walter, Arkada, Washington Ter.

Stamp-Mills. — Giles S. Olin, Deer Lodge, Montana Ter.

Candlestick.—Samuel D. Hill, Downieville, Cal.

Shaft-Coupling.—Wm. J. Silver, Salt Lake City, Utah.

Process for Softening and Toughening Blocks of Wood.—George W. Swan, S. F., Cal.

Fruit and Berry-Basket.—George W. Swan and Wm. Finch (said Finch assignor to said Swan), S. F., Cal.

Machine for Making Boxes.—Geo. W. Swan, S. F., Cal.

Bolt and Rivet-Machine.—Napoleon Beaursgard, S. F., Cal.

Laundry Stove.—James H. Mitchell, S. F., Cal.

Rotating Blanket Sluice for Washing Ores. —Wm. H. Patton, Oakland, Cal.

Mill-Pick.—Morgan N. Young, Kelseyville, Cal.

Windmill.—Harry H. Bodwell and Ephram A. Atwood, S. F., Cal.

Hand-Wagon. — Sylvester D. Scott, Eureka, Cal.

---

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

An Important Home Industry.

The strength and wealth of a nation are known by her manufactures, and the prosperity of a people is always indicative of the skilled artisan and mechanic turning the useless and crude material into articles of use and benefit to mankind. Referring to our industries, the glass works of our city call to mind one branch of manufacture that should be a source of great wealth and pride to our people. We have in abundance all the material, of a superior quality, lying at our very doors; skilled workmen and facilities for producing first-class products. The amount of glassware used upon our coast is sufficient, if of home manufacture, to build up and give employment to as great a number of people as any business carried on. Such business should be fostered and encouraged.

We have now in successful operation quite a large factory, that of the San Francisco Glass Works, C. Newman, proprietor, on Fourth street, which is employing regularly forty-five hands. Every operation directly or indirectly contributing to the completion of the finished product is carried on at these works. Here are made a great variety of glass carboys, bottles, viale, jars, dead lights, etc., which are coming more and more into use, as the wine-growing and other interests advance, thus proving the mutual dependence of the different industries. Some idea of the quantity of work turned out will be gathered from the fact that 6,000 vials and bottles are made daily, the company doing a business of $100,000 annually. There are several specialties here made, concerning which we are too limited in space to go into detail, such as Taylor's patent soda bottle, which is made with a vent hole in the neck by one machine, and filled at the soda water works by another, thus rendering it impossible for outsidere to steal the trade mark. Another is Newman's Patent Improved Imperial fruit jar, which is the most simple and effective jar now in use. Besides these, there are some hundred private molds. But any one who has had the pleasure of seeing a large glass factory in full blast will readily supply the minutiæ of the picture.

Mineralogical Notes on Utah, California, and Nevada.

[Concluded from our issue of August 80.]

Ulexite.

The boronatrocalcita of Ulax proves to be an abundant mineral iu Nevada and Arizona. Tha specimens of this species, which I hava examined, are from near Columbus, Esmeralda County, Nevada, whera it occurs in beds of considerable extent, mixed with sulphata of soda and gypsum. It is found in round masses, as large as the fist and larger, which, when broken, show the fine fibers of eilky luster, not to he distinguished from the *tiza* of Peru. This species, it is said, occurs abundantly in the Arizona desert, and also near Wadsworth, Nevada, much minglad with dirt.

Near Columhus, Nevada, they have likewise found larga quantities of borax diffused in the soil, and Prof. Price informs me (June 6, 1873), "that all the borax produced there is obtained by lixiviating the soil and crystalizing out the borax in the usual way. I have been informed by trustworthy parties that thay can manufacture at least forty tons of commercial borax every day; the difficulty is to find a market for so much."

About twenty miles west of San Bernardino, California, is the so-called "Cane Spring District," where ulexite is found over an area, said to be ahout ten milae in width by fifteen in langth. The surface of the ground is covered with efflorescent salts, commonly known as "alkali," beneath which the borax salts (chiefly *ulexite*) are found, at a depth of a faw inches, when they exist at all. As these "alkaline" wastes ara now attracting attention from the commercial importance attached to tha borax salts, we may hope to obtain yet other contrihutions of intaresting species. The saline salte removed in obtaining the borax salts recur agaiu after an interval of time, during which the process of solar evaporation in a rainless region bringe up by capillary action from a lower stratum fresh portions of the saline solutions. It is a fact long familiarly known to travelers in these desolate regions, that while tha lagoons, where any exist, contain only water too strongly salina to be drank, that wells sunk to a moderate depth in the saline soil afford water which can he used. This water is only a more diluta solntion of the sama salts, which on reaching the surface by capillarity, form the peculiar "alkali" incrustations of the desert.

Borax.

On the eastern slope of the Sierra Nevada, not far from Walker's pass, borax is found in what appears to he tha bed of an ancient lake, large crystals of tinkal having bean found in the hardenad mud, like the well known crystals of horax found in tha mud of Clear Laka in California. But by far the largast quantity of the borax exists with other salts, incorporated in a sort of indurated mud from which it is extracted by lixiviation.

I have examined several samples of this material which Prof. Prica has kindly sent me. One of them, by his assay, contains ahout half its weight in horax. It is a light clay-like looking body, with a strongly saline and alkaline taste, effervesces with dilute hydrochloric acid, and tiuges the flame of alcohol green. They ara all alike in reacting alkaliue, and for sodium, boracic acid, chlorine aud sulphuric acid. The portion insoluhle iu water is attacked by dilute hydrochloric acid with effervescence, and contains alumina, lime, a little ferric oxide and magnesia. Minute crystals of gypsum axist in some of them, hut no gaylussite, glauberite or boracita could be detectod. Similar daposits, containing borax, exist iu Panamit and Death's Valley in Lower Nevada, which desolate districts have yet to receiva a careful scientific examinatiou, for which, in Professor Price's opiniou, they offer an intaresting hut certainly not very inviting fiald. There are few parts of the earth's surfaca where human life and endurauce are more severely tsxed.

Chrysocolla.

This species, in specimens of unusual size and beauty, is found in a vein, or heavy deposit, of thirty to forty feet in thickness, in the railroad mining diatrict, Elko country, Nevada. Ahove ona hundred tons of it were sant last year to the Revere Coppar Company, whare it yielded 28½ par cent. of copper.

Compact Anglesite.

This variety of anglesita occurs in large quantitiea at the Union mines near Cerro Gordo, Inyo county, California, in an Alpiue region ahout twenty miles east of the Sierra Nevada mountaina, and at an elevation of mora than 8,000 feet above tide. Tha mineral vein, or ore deposit, occurs in limestone and makes its appearance on tha wast slope of the mountain (which rises some thousand feet or more higher thau the vein). It was indicated at surface by a few boulders or isolated masses of galena, which, on exploration, ran into a nearly continuous masa of galena, mixed with a reddish-brown sand colored by sesquioxide of iron, but without quartz or epigene speciea derived from lead. Singularly enough, the carbonates of lead occur *below* the anglasita, mixed with the latter speciss and with galena. At the depth of 600 feet from surface, the ore course is about fifty feet wide, the entire absence of water at that depth and above being a noticeable fact, in considering the paragenesis of species. Water ia brought by mules and Indiane from a distauce of soma milea, to supply tha hoisting machinary and other needs of tha mine, at a cost of 10c. per gallon, and is economized by a careful coudensation.

This anglasite often includes unchanged galena. It is of a gray to grayish yellow color, sometimes dark, or with seame of yellow covered with druses of small crystals of anglesite, which are quite colorless, brilliant and trsns-parent. The masses ara banded like agates. Its density is 6.08, and its pyrognostic characters are tbose of anglesite. It contains on an average of mining samples about 55 ozs. of silver to the ton of 2,000 lbs., which is materially less silver than is found in tha unchanged galena. The "bullion" (silver lead) of tbis mina as sent to tha market contains about 120 onuces of silver to the net ton. My informant for these economical facts is Mr. F. F. Thomae, a graduate in Arts and Science at Yale, who is iu charge of tha smelting works at these mines.*

Platinum and Iridosmine.

Since the pnblication (this Jour., v. 384) of my nota on the crystalline sands of the Cherokee gold washing in Butte county, California, I have obtained, through tha kindness of Mr. G. A. Treadwell, who at my suggestion gave the proper directions, samples of tha heavy sand, which accompany the "clean up" of the gold to the last stage of concentration before going into tha melting pot. These heavy sands I find to be largely composed of scalee of platinum mixed with yet more abundant iridosmine. When the adhering mercury and other foreign matters which disguise the trua character of the platinum residues are removed by a slight washiug in acid, the heauty of these speciea is seen, and it is quite easy to select each by the aid of a glass. A few minntes zircons and brilliant microscopic crystals of chromite (?) wera selacted from the sample of about 25 grams which I received. The search for laurite and the anomalous mineral believed by Dr. Genth to be new (this Jour. II, 246), which he described ae occurring among sands from California, in 1853, was not euccassful.

Mr. Glass, the resident manager, informs me that the platinum and its associate minarals ara quita abundant at Cherokee, but as the quicksilver does not amalgamata them they hava no means of escape from the mechanical force of the stream which washes away much the larger part, thus entailing a loss which thare is no means now known to prevent.

Platinum and iridosmina were very early observed in Califoruia hy Blake and others, amoug especially the sands of the eurface placers near the sea, on the northern coast and in Oregon. But I believe this is the first notice of their being found in the older deep placers now so extensively worked by the hydranlic process.

The "Black Sands"

of the Cherokee deep placer washings I find to ba composed chiefly of *chromites*. Tha magnet selects quite sparingly a few crystals and masses of *magnetite*, soma of them heing also strongly magnetic. An occasional mass of brown iron (*limonite*) occurs, giving off water in the tuhe, becoming magnetic by heat, and reacting ouly for iron. The eearch for *ilmenite* resulted iu finding only chromita, with its well-marked raactions, It is highly improbable but that ilmenite exists, but I have not yet after some time and much pains succeeded in finding it. Tha mass of sauds searched hy an exploring-glass, discloses eome other species hesides the abounding zircons, amoug which the most conspicuous is *rutile* in minuta prisms of a fine red color, transparent, sometimes doubly terminated, hut rarely compounded; 68 of these little crystals of rutile weigh only 58 milligrams; garnets, epidote, and a faw minute fragmente undetermined ara sparsely found. We may therefore enumerate the miueralogy of tha Cherokee washings, so far as known, as yielding gold, platinum, iridosmine, diamond, zircon, topsz, quartz in several varieties, chromite, magnetite, limonite, rutile, pyrite, almadine garnet, epidote. A further search on larger samples of the sands will undoubtedly reveal yet other species. The matrix which has furnished most of the species enumerated (the gold and platinum metals probably excepted), is probably syeuite, boulders of which are among the frequently recurring factors of the gravel mass.

Sands of the Arizona Deserl.

The search for "diamonds," "rubies," and "emeralda" in 1872, led to the sending of saveral expeditiona into Arizona and southern Nevada. I have had, by the kindnesa of Mr. Geo. A. Treadwell, an opportunity of examining a portion of the findinga of one of these parties, which explored a region about eighty-five miles northwest of Fort Defiauce in Arizona. The region is described as one of porpbyritic and other eruptive rocks. Tbe "rubiea" are garnets, somo of very fine color and good size, but wbether pyrope or common garnet, an analysis only can determine. Some, cut in San Francisco, which I hava seen, compare well in color and beauty with the Bohemian stones. The "emeralds" are chryaolite, too faint in color to ba used as gama. The "diamonds" are quartz, some opaliue, others hyaline, and all smoothly polished. Iu addition, I find the alalite variety of pyroxene, fluorite (white), magnetite, ilmenite, oligoclasa and jasper.

* The compact anglesite from Arizona, described by Prof. Brush in this Journal, (III, v, 421)is not distinguishable from the Cerro Gordo mineral.

THERE are 154 blast furnaces in Scotland, of which 120 are blowing, against 132 at corrasponding period last year.

Cork Production and Manufacture in Spain.

The cork tree is found in its wild state in the south of Portugal, Africa and Spain. In the latter country the preparation of the bark for foreign markets is one of the stsple industries, furnishing labor and subsistence to a large proportion of the inhabitants.

The traa is a peculiar kind of oak, and the cork is tha soft cellular bark, lying just inside the exterior woody covering. It is removed by making several longitudinal clafts up and down the trunk, and then girdling the latter with horizontal incisions. The operation is not performed, however, until the tree has attained a cartain age, generally fifteen years, and the first crop is employed only for inferior purposes. Saven years afterwards the tree will have another coating of bark, which is stripped and used for making corks, and so on every five to seven yaars, according to the quality of the ground. Tha tree does not suffer from tha process of scraping, and it is said generally lives from one to two hundred years.

Between the cork and the trea there is another bark that is used for tanning; but this is only removed when the tree is cut down. It is a curious fact that if any portion of this inner coating be destroyed, further formation of the cork on tha injured spot ceases. After tha layers of the cork are stripped, they are inspected and assorted, according to their sizes and quality, those of the finest texture being of tha greatest valne. The inferior portions are genarally sorted ont, their crust burnt off and sold mostly for floats, thus receiving the nama of fishing cork. The better qualities are first boiled and scraped, and then blackened over a coal fire, the object being to maka the surface smooth, and at the same tima to conceal flsws. Some varieties, generally the best, are faced in ordar to exhibit the finenss of thair texture. After being forwarded to the warehouses, the largest slabs are cut into pieces of about three and a half feat in length, eighteen inches iu width, and ranging from one-half inch to three inches in thickness. Drying and packing in bales weighing one hundred and fifty pounds each follows, and the oork is ready for exportation.

From five to twenty-five cents per pound is tha usual prica paid by the cork cutter in America for the rough material as it arrives in tha bala. It then undergoes another assorting, and thorough steaming, in a chest designed for the purposa, the latter process softening tha cork, and rendering it easy to cut. To divide tha substance special machinery is employed. Rapidly revolving circular knives are used, which cut hy a drawing motion, as crushing strokes simply break the cork or causa it to crumble. The workman sitting in front of tha machine plsces a piece of cork of suitable size in a revolving spindla by which it is firmly held. The spindle is raised a measured distance, and the edges of the cork come in contact with the rotating knife, which smoothee them off and leaves its work in a parfectly cylindrical form. Another method is to place tha rough bits of cork in grooves on the circumferance of a wheel which, working automatically, carries each piece to a point where its ends ara received hy a small latha. The cork is then revolved slowly whila a large circnlar knife removes a thin shaving, thus giving it the necessary tapar, and a surface as true and smooth as if sand-papered. As fast as the cork is finished by the automatic lathe it is released and another substituted in its place.

Every portion of the material is utilized, either as stuffing for cushione or life presarvers, or as a non-conducting substanca for placing between walls or floors of buildings to deaden sound.

Robinson District.

In conversation with D. T. Elmore, superintendent of the Watson Silver Mining Company at Mineral Hill, Robinson District, we were informed that everything out his way looks prosperous, and promises of a large camp are abundant. The Hayes Company's mines still contiuue to show large bodies of free milling orea, aud, as depth is attained, no decrease in quantity, and a decided increase in quality is apparent. Tha mill under process of eraction by the Watson Company, is rapidly approaching complation, and will soon be ready for a start. The pans, settlers, and engine are all in position, and, we are informed, that as soon aa posaibla a start will be made without awaiting the completion of the building over the works. It is intanded to maka the firet run on the rock of the Hayes Company, and every confidenca is entertained of aucceas in working. A great deal of the future of Robinaon aud contiguous districts depend upon the result of tha working of this mill, and when it is damonstrated beyond a doubt that the ores abounding so plentifully at this locality can be successfully worked, a rush of capital will surely be the result, and Mineral City vie with auy camp in Eastern Nevada as an ore producer. It is surmised that the Canton Company will shortly build a mill to replace the furnace now lying idle, and, should such be the fact, with tha enormous qnantities of ore in sight, and on the dumps at their mines, an additional impetus wonld be given the district. We are aware of several partiea having means at their command, who are simply awaiting the result of the workings of the Watson Company's mill, to at once commence operations on other properties there. With tha larga agricultural intareste around and about Mineral City, nnited with the mineral products of tha vicinity, a town second in aize to none in Eastern Nevada may safely ba predicted the coming year.—*White Pine News.*

California Gold at the East.

The sum of $2,000,000 in gold coin arrived on the 19th ult. at the Sub-Treasury, in New York, having heen forwarded by express from the San Francisco Sub-Treasury. According to the usual method of reckoning tha weight of gold coin, says tha New York *Post*, the weight of the amount was about four tons. When gold is shipped in tbe ordinary mauner, in kegs of $50,000 each, it is customary to consider $500,000 equal to a ton; but as the iron-bonnd oaken kege form au item in tha estimate, the net weight of the gold is somewhat less. When the law for the recoinage of all gold pieces which had suffered from abrasion had been partly carried into effect, the Aesistant Treasurer at Boston notified the Treasury Department that he had more gold than he needed, and a considerable amount was therefore sent from Boston to New York. Mr. Aehley, the chief of the coin division in the Sub-Treasnry here, says that he supposes tha Department is carrying out tha sama policy in regard to Ssn Francisco, this being the only city where the Govarnment needs to keep gold in large quantities for mercantile purposes.

The $2,000,000 sent from here was packed in twelve strong iron chests, each about two and a half feet in length by sixteen inches in breadth and depth. The gold, which consists entirely of doubla eagles, was in stout canvas bags, one hnndred in number, each containing $20,000. Every hsg bore a seal sffixed by the Assistsnt Treasurer at San Francisco, and each of the chests had three combiuation locks, which the Assistant Traasurer secured. The explanstion of the combination was sent to Assistant Treasurer Hillhouse, of Naw York, in two instsllments, one by mail and ona by express, so that if either fell into wrong hands it would afford no information. The treasure was hrongbt overland from San Francisco by tha Adsms Express Company, which was responsible to the Government for its safety. Tha car containing it was guarded by uine armed men. On the arrival of tha gold in New York it was carried in express wagons to the Sub-Treasury, where the chasts, weighing between 600 snd 700 ponnds apiece, were placed on trucks snd rolled into the coin division.

The bags wera than amptied and the contents of aach counted by weighing. The exact weight of $20,000 in gold coin being known, the absence of a single pieca would he instantly detacted. About $1,000,000 of the amount was fresh from the mint, and this it was necessary merely to weigh. The rest, having been in circulation, must be examined piece by piece to see that avery one is genuine. So larga an amount of gold is rarely received at tha Treasury at ona time. Thesa trips are in pursuance of a distinct policy of the Treasurer, by which the greenhacke ara expected to ba brought into general circnlation thera, and gold coin enough will be accumulated on this side to meet any emargency which may arise from gold or other combiuations. Soma criticism has been msde of tha sending of special mesengers on such trips, but, for a long distance, it is found chaaper to do this than to send hy express.

THE MULLIN'E & RYAN GRAVEL CLAIM.—The Calaveras *Citizen* says that this claim, situsted on Central Hill, has been worked for over seven years, during which tima a tunnel bas been run 1200 feet in search of the lead, but until lately without success. After spending all their means in what seemed to ba a wild goose chase, tha proprietors—Meesrs. Mullins Ryan, and the Harkin's Bros.—stopped work. Ona of the partners went to Oregon, ona to San Francisco; and, although the other two stayed here, they were unable to make any headway in opening the mine. This was the condition of affairs when Mr. Dyas bought one-half of the claim, soma three or four montha ago. Already had $50,000 been expended in searching for the lead, aud the proapect was indeed gloomy. Notwithstanding this, after Mr. Dyas had made a careful survey of the ground, he came to the conclusion that the laad was there, and that he could do what others had failed to do—find it. With an expectation that it would be a work of time and necessitate the investment of conaidarable filthy lucre, he made the veuture. And now comes tha atrange part of tha story. Under Mr. Dyas' management, the tunnel had not been driven ovar four feet, whan the lead was fouud and gold was visible in the gravel on all aides. They had atruck tha famous Blue Lead, one of the "daad rivers" of California, and in which haa been found some of the bast paying claims in the State. There has been no claim struck in Calavaras for yaars which will compare in richness with this. The claim is 800 feet in length, and the pay-streak is 110 faet from rim to rim, with a thickness of saven feet independent of the crevicea, which are abundant. The claim will undoubtedly last for yeara, adding much to the prosperity of our county, and encouraging others to venture their capital hera, and it is just as true that had it not been for Mr. Dyas' confidence in our mines, in all probability the lead would naver have been discovered. Ha haa had extraordinary good luck in both quartz and gravel mines in this county, and is doing much toward davaloping its rasources. We wish him a continuation of his present success.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS
ALSO, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & Co., Publishers, and Patent Agents, S. F.

BURLEIGH
ROCK DRILLS
—AND—
Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet daviaed for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel, L. I.
Mess. Shanley,.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Roebling .....East River Bridge Company, N. Y.

BUSINESS EDUCATION — HEALD'S — GOOD INSTRUCTION
BRYANT & STRATTON
BUSINESS COLLEGE
OPEN TO ALL — 24 POST ST. SAN FRANCISCO — SEND FOR CIRCULARS

The object of this school is to impart a thorough education in business affairs. It is open to persons of both sexes and of all ages. There is an English Department for those not sufficiently advanced for the Business Course. Sessions continue day and evening throughout the year. Students can enter at any time. All wishing to be successful should secure a practical education at this College. Send for "Heald's College Journal," and learn full particulars. Sent free to all by addressing E. P. HEALD, Pres. Business College, San Francisco, Cal. 2v27-1y

PROPOSALS FOR
MATERIAL and WORK
FOR A PORTION OF THE
NEW CITY HALL
AND
HALL OF RECORDS.

OFFICE OF THE BOARD OF CITY HALL COMMISSIONERS, corner Leavenworth and McAllister streets, San Francisco, August 14, 1873.

SEALED PROPOSALS,

For Furnishing certain Material and for doing certain Work for a portion of the New City Hall and Hall of Records, will be received at the office of the Board until 12 o'clock noon of Friday, the 19th day of September, A. D. 1873, as follows:

1—BRICK-WORK—Bricks laid in the wall, with Face-work extra, and Setting Blocks, Keystones, Capitals, Springing Blocks, Iron Plates, etc., and providing and setting Iron Bonding and Arch and Chimney Bars, etc.

2—STONE AND STONE WORK—Granite Blocks, Key-stones, Capitals, Springing Blocks, Stone Creasing, Internal Granite Columns of Hall of Records, etc., provided and worked.

3 IRON WORK—Wrought Iron Girders for Third Floor, provided and set.

4—IRON WORK—Cast Iron Columns, Girders, Lintels, Brackets, etc., for Hall of Records, provided and set,

5—IRON WORK—Dome of Hall of Records, complete.

All according to specifications, plans and drawings to be furnished by the Board.

The expenses of advertising will be charged pro rata to the successful bidders.

DR. ABORN,
Physician and Operating Surgeon
FOR CHRONIC DISEASES,
213 GEARY STREET, - - - SAN FRANCISCO.

Diseases of a chronic and obstinate character, especially such cases as have for years, or a lifetime, resisted the ordinary modes of treatment, are the class of maladies in the treatment of which Dr. Aborn has become pre-eminent on the Pacific Coast, as well as throughout the Union, and by his success has achieved for himself an enviable reputation. 23v25-1y

SPARROWS vs. MOSQUITOES.—In view of the recent proposition to import the English sparrow into this State, it may he interesting to note that this little bird is said to wage a most nnrelenting warfare npon mosqnitoes as well as worms, and that that annoying insect is said to be fast disappearing from the city of New York as the sparrows increase in nnmber there. If this is a fact, the peace and comfort of nnmerons citizens in varions parts of California might he greatly improved hy their free introdnction and mnltiplication here.

TO THE PUBLIC.

THE PAIN-KILLER manufactured by PERRY DAVIS & SON has won for itself a reputation unsurpassed in medicinal preparations. *The universality of the demand* for the Pain-Killer is a novel, interesting and surprising feature in the history of this medicine. The Pain-Killer is now regularly sold in large and *steadily increasing* quantities, not only to general agents in every State and Territory of the Union, and every Province in British America, bnt to Bnenos Ayres, Brazil, Uraguay, Peru, Chile, and other Sonth American States, to the Sandwich Islands, to Cnba and other West India Islands; to England and Continental Europe; to Mozambiqne, Madagascar, Zanzibar, and other African lands; to Australia, and Cslcntta, Rangoon and other places in India. It has also been sent to China, and we doubt if there is any foreign port or any inlsnd city in Africa or Asia, which is frequented by American and European missionaries, travelers or traders, into which the Pain-Killer has not been introdnced.

The extent of its usefulness is another great feature of this remarkable medicine. It is not only the best thing ever known, as everybody will confess, for bruises, cnts, burns, etc., bnt for dysentery or cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of British India and the West India Islands and other hot climates, it has become the *standard medicine* for all such complaints, as well as dyspepsia, liver complaint, and other kindred disorders. For conghs and colds, canker, asthma and rhenmatic difficulties, it has been proved by the most abundant and convincing trials and testimony to be an invalnable medicine. The proprietors are in possession of letters from persons of the highest character and responsibility, testifying in unequivocal terms to the cures effected and the satisfactory results prodnced, in an endless variety of cases, by the use of this great medicine. That the Pain-Killer is deserving of all its proprietors claim for it is amply proved by the unparalleled popularity it has attained. It is a *sure* and *effective* remedy. It is sold in almost every country in the world and is becoming more and more popular every year. Its healing properties have been fully tested all over the world, and it need only to be known to be prized.

Sold by all Druggists. sep13

A NEW BOOK.

Leather Market Report.

[Reported for the PRESS by Dolliver & Bro.]

Leather does not change in price, though inqnlries are more frequent of late. That qnotations are hardening is evident. The trade has been expecting a change for the better for some time, without realizing it as yet, bnt now appearances are more favorable thau they have been for a long while.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important bnsiness with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thonsands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not ouly more readily apprehend the points and secure mnch more fully and quickly the patents for our home inventors, bnt with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, npon the recommendation of honest and intelligent pnblishers.

To Obtain Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It mnst not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address npon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, emhodying all the ideas and claims of the inventor respecting the improvement describing the varions parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made np, and soon sent to the inventor for signing.

As soon as signed and returned to ns with the fees then dne ns, it will he sent straightway to the Patent Office at Washngton.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, mnst he furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send ns an exact description, and what is desirable to claim.

For designs no models are necessary. Dnplicate drawings are required, and the specifications and other papers should he made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Address DEWEY & CO.,
PUBLISHERS, PATENT AGENTS AND ENGRAVERS,
No. 338 Montgomery street, S. F.

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE CO. J. B. Roberts, 315 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

THE MINING AND SCIENTIFIC PRESS.—We commend it especially to the miners of Colorado.—*Denver (Col.) News.*

PURCHASERS please say advertised in Scientific Press.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its pnblishers have gained for its conduct an amount of practical experience greater than any other pnblishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valnable information.

Every Mining Engineer, Snperintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,
Publishers, Patent Agents and Engravers.

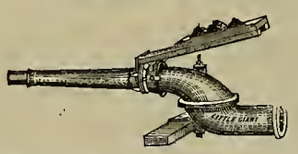
Machinery.

TO HYDRAULIC MINERS.



I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an improved LITTLE GIANT.

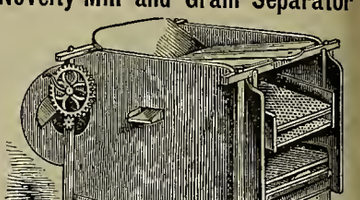
THE PATENT
Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

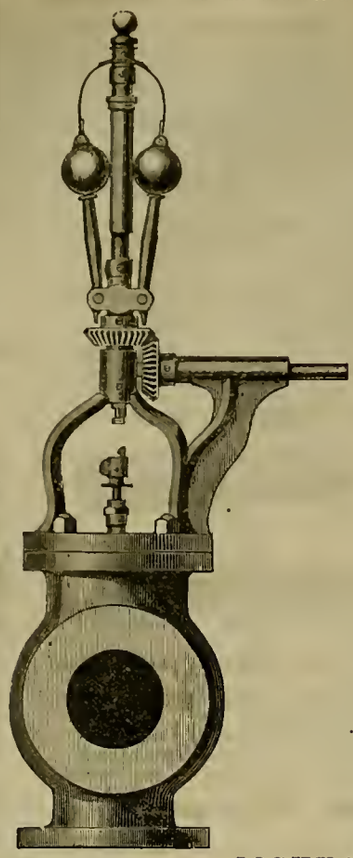
Varney's Patent Amalgamator.
These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the appertures and between the grinding surfaces.—Hence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street,
San Francisco.

NICKEL PLATING.
The San Francisco Nickel Plating Company are prepared to plate articles of all descriptions, of any metal. Cutlery, Liquor Flasks, Pistols, Guns, Swords, Bridle Bitts, Pole Crabs, Hub Bands, Dash Rails, and all articles of household hardware plated at short notice, and warranted. Nickel Plate never tarnishes or corrodes, always retaining its polish until the article is worn out. Office at the KIMBALL MANUFACTORY WORKS, Cor. Fourth and Bryant Streets. 12v26-3m

HENDY'S
IMPROVED STEAM ENGINE REGULATOR.
OVER 400 HAVE BEEN PUT IN USE.



RECOMMENDATION.

ST. PATRICK MILL, Placer Co., Feb. 10, 1873.

JOSHUA HENDY, ESQ., SAN FRANCISCO:

Dear Sir: We, the undersigned, take pleasure in giving you the following testimonial as to the merits of the Hendy Governor, which we ordered from you about four months ago. Though more than pleased with its workings at first, we deferred writing until we had tested it thoroughly.

Our engine is 12x36 (carrying 70 lbs. of steam), driving 15 stamps, 725 lbs. each; 1 Wheeler Pan, 1 Knox Pan, 6 Hendy Concentrators. The discarded Governor was the common "Arm and Ball Governor;" it giving but poor satisfaction, we decided to try the "HENDY," and are pleased to report in its favor for the following reasons:

1st. IT SAVES US FUEL. Previous to attaching your Governor we were burning 3¼ cords of wood per 24 hours. We now consume but 2½ cords doing the same work.

2d. FOR SAFETY. The "trip" saved us from an expensive smash up but a few days ago, during the temporary absence of our engineer. The Governor belt ran off the Pulleys. Your little automatic trip worked like a charm, and but one or two revolutions was the result, and no damage. Had we been using any other Governor, the probability is that we would not have had a whole cam in the mill.

3d. IT IS A PERFECT GOVERNOR. We can turn off the Wheeler Pan and hang up one-third of our stamp, without any perceptible change in speed.

4th. THE ADJUSTMENT for regulating the speed without increasing or reducing the size of our Governor pulley, is admirable, and as easily managed as setting a clock.

5th. IT IS SIMPLE and not liable to get out of order, or requiring more than ordinary care.

Yours respectfully,

JAS. H. CROSSMAN, Supt.
GEO. H. BARNEY, Chief Eng'r.

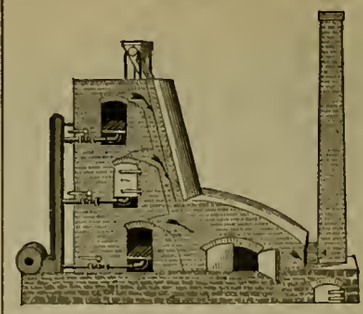
EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing
ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.
The claims of the inventor are—
Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.
It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.
Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

[MINING SUMMARY — Continued from Page 165.]

vigorously ahead to tap the ledge and drain the water. All the ore breasts and slopes throughout the mine are looking and yielding splendidly as usual. The Mexican mill has had to suspend operations for necessary repairs. The Devil's Gate mill will start up crushing ore from the mine to-morrow.

UTAH.—The pumping machinery of this mine is all in place except the large spur-wheel, which is now being fitted. The pump-column, pump-rods, and all else, will be in place and the machinery ready to start up to-morrow. The main shaft, which is now down 250 ft., will be sunk to the depth of 300 ft., when a drift will be started for the lead. It will probably be about six weeks before they are ready to start the drift. The new pump will be of sufficient capacity to handle all the water they are likely to find upon tapping the lead.

CONSOLIDATED VIRGINIA.—The large and commodious carpenter, blacksmith and machine-shops adjoining the new hoisting-work are nearly completed. The foundations for a large ore-dump on F street are being laid; the excavation for the pumps and tanks in the shaft are finished, and the aligament of the pumps and columns in the main shaft will soon be commenced. The main drift north, on the 1167-ft. level, from the Gould and Curry shaft, is making much better progress, the heavy body of water, tapped some time ago, gradually lessening in quantity as the drift progresses.

OCCIDENTAL.—The ore breasts on the various levels are looking splendidly and yielding the usual amount of ore, keeping the company's mill steadily running.

OVERMAN.—Most of the past week has been spent in putting in the plunger and other pumping machinery at the 1100-ft. station, so that little headway in sinking the shaft has been made. The main west tunnel, at the 1000-ft. level, is still driven vigorously ahead without change of interest. Both the southwest and northwest drifts from the main tunnel, at this station, are being pushed steadily ahead.

HALE AND NORCROSS.—Daily yield, 60 tons of ore, which is being reduced at the Trench mill. The ore breasts show but little change since our last report. The ore yield from the old upper levels continues much the same. The prospectiug drifts on the lower levels are being pushed rapidly ahead with very encouraging prospects.

JUSTICE.—The main south drift at the 400-ft. level of the old works is still driven steadily ahead, with good indications of soon cutting the main ledge. The north drift at this station is being pushed steadily forward without any change of interest to note. The main south drift at the first station, new works, is making good progress, and shows some fine ore.

SILVER HILL.—Daily yield, 60 tons of ore, mostly from the ore breasts at the first station. The cross-cut at the second station has developed a fine body of excellent milling ore, proving, beyond a doubt, the extent of the ore body from the first to the second stations, a distance of 100 ft. in depth. The Bacon mill is kept steadily running, crushing ore from the mine.

OPHIR.—The main south drift at the 1300-ft. level is still driven steadily ahead, the ore body showing a gradual and steady improvement, and bidding fair to prove a rich and valuable development. Work, which was suspended during the foro part of the week at the 1700-ft. level, has been resumed, and valuable developments at that level may be looked for soon.

IMPERIAL.—Sinking the main incline is making excellent progress, the rock in the bottom working finely. The south drift at the 1700-ft. level is making good progress with no change of material interest whatever to note. Prospectiug in other portions of the mine continues as usual, with no new development to record.

JULIA.—The main east drift at the 800-ft. level is still driven ahead through low grade ore of a very promising character. Lowering the water in the shaft is making good progress, having been reduced at the rate of 3 ft. per day during the past week. It is expected that the 1000-ft level will be ready to resume operations in about 15 days.

ARIZONA & UTAH.—Sinking the shaft is making excellent headway. A streak of quartz was encountered in the shaft during the week that hids fair to develop into an excellent body of ore. The incline is making good progress downwards, following the footwall of the ledge, occasionally cutting bunches of low grade ore.

AMERICAN FLAT.—The southwest drift on the line of the ledge from the main west drift at the 450-foot level of the Baltimore shaft is pushed steadily ahead, running nearly parallel with the ledge. Crosscuts to prospect the ledge will be started in a very short time.

WOODVILLE.—Daily yield of 20 tons of good ore. The different ore stopes are all looking finely, and the drifts both north and south show considerable improvement.

YELLOW JACKET.—Still prospecting the 1400 and 1500-foot levels. No new developments of value to chronicle.

SUCCOR.—The main east drift from the second station, in the new shaft east of the cañon, is making good progress.

KNICKERBOCKER.—The main west drift at the 450-foot level, is still driving steadily ahead the face in a mixture of clay, quartz and porphyry. The rock in the face of the southwest cross-cut from this drift is much softer than at our last report, admitting of much better progress.

DAYTON.—Drifts both north and south have been started on the ore vein at the first station, which at this point is ten feet in width of hard blasting ore, of an excellent quality. The main west drift at the second station is making good headway.

CALEDONIA.—The ore body developed at the 500 feet level continues to show a decided improvement, both in the quality and quantity of ore contracted. The Sapphire mill is kept steadily running crushing ore from the mine.

SIERRA NEVADA.—Daily yield, 60 tons of ore, keeping the company's mill steadily running. The ore breasts in the upper portions of the mine are being gradually extending to the north and westward, and continue to yield finely.

CHOLLAR-POTOSI.—Daily yield, 150 tons of ore. Prospecting at the fourth station continues without change of interest to report. The ore breast in the old upper workings of the mine continue to look and yield well.

SAVAGE.—Sinking the incline is making excellent progress, the rock in the bottom working well. Prospecting the 1,600 and 1,700 foot levels continues, without any new developments of material value to report.

DANEY.—The new pumping and hoisting machinery will be completed, and sinking the shaft resumed, about the 15th of the present month, when some good developments may soon be looked for.

EMPIRE.—Prospecting and cross-cutting at the 1,600 and 1,700-ft. levels without material change of intereat to note.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

EL DORADO WATER AND DEEP GRAVEL M. CO., Sept. 5. Object: To purchase and acquire water privileges; to purchase, construct and maintain canals, reservoirs and water ditches for agricultural, milling and mining purposes in any county of the State; to supply fresh water to any city in the State; to purchase and work mines and carry on a general mining business in El Dorado. Directors: John O. Earl, J. D. Fry, Thomas Price, L. A. Garnett, Henry D. Bacon. Capital stock: $500,000, in 5,000 shares.

FARMERS' JUTE MANUFACTURING CO.—Sept. 10. Object: To manufacture all kinds and descriptions of jute fabrics, and the sale of the same; and to purchase and erect suitable machinery, buildings and sites to carry on said business. Directors—F. Fillips, William Wagel, A. S. Peterson, S. J. Simon, and Thomas S. Moffit. Capital stock, $500,000, in shares of $100 each.

BERKELEY VILLA ASSOCIATION.—Sept. 10. Object: To purchase and pay for a certain piece of land in Alameda county; to divide the same into lots and to distribute such lots among the stockholders in such a manner as may be found most conducive to their interests. Capital stock, $98,000, in shares of $350 each. Directors—Felix Chappelette, H. B. Berryman, William Stuart, Frederick M. Berryman and William Craig.

Meetings and Elections.

PACIFIC TUNNEL M. CO.—Trustees: Hill Beachy (President), S. A. Raymond, C. P. Hall, O. Fuller and T. C. Sanborn. W. H. Knight, Secretary.

NOONDAY S. M. CO., Sept. 3.—Directors: O. H. Bogart (President), Lewis Vesaris, R. H. Rogers, Geo. W. Cope and Thomas Mason. Joseph Maguire, Secretary; O. H. Bogart, Treasurer; H. A. Woodman, Superintendent.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees: list of Government fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

TO RENT LOW.

A Room—large or small—suitable for Printing, Bookbinding, or other business, at No. 414 Clay street, near Sansome. Enquire at this office or on the premises.

For Steam Pipes & Boilers **Hair Felting**

SAVES 25 PER CENT. OF FUEL.—An item worth looking after. Also, Steam Governors, Tube Scrapers, Steam Pumps, Self-Oilers, Cylinder Cups, Steam Gauges, Belting, Lacing, Hose, Fuse, Packing, etc., including all kinds Miners', Engineers' and Millmen's supplies. TREADWELL & CO., old stand, Market St., and of Front, San Francisco. 8v26-eow

PROPOSALS FOR MATERIAL

FOR A PORTION OF THE

New City Hall Building

OFFICE OF THE BOARD OF CITY HALL COMMISSIONERS, corner of Leavenworth and McAllister streets, San Francisco, July 19, 1873.

SEALED PROPOSALS, For Furnishing certain material for a portion of the New City Hall Building and Hall of Records, will be received at the office of the Board, until 12 o'clock, noon, of WEDNESDAY, the 1st day of October, A. D. 1873, for the following:

ROLLED IRON JOISTS,
WROUGHT IRON GIRDERS,

All according to Specifications, Schedule, Plans and Drawings, to be furnished by the Board.

No Bid will be entertained unless made on the "Printed Forms of Proposal," and accompanied by a bond with two good and sufficient sureties, in a sum equal to 10 per cent. of the total sum of the tender, conditioned for the due enteriog into the contract of the party to whom it may be awarded.

The Bids must be endorsed for the Material proposed to be furnished, and addressed to the Secretary of the Board.

The Specificatioos, Schedule, Plans and Drawings can be seen, and all further information obtained at the office of the Board, where also Forms of Proposal will be furnished to intending bidders.

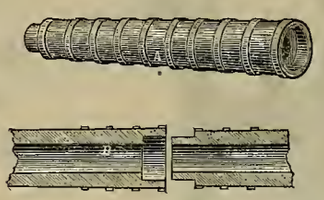
The Board reserves the right to reject any or all bids.

Payments will be made monthly, to "City Hall Warrants, of 15 per cent. of the estimated amounts due, and the remaining 25 per cent. when the contract is completed.

The expense of advertising will be charged pro rata to the successful bidders.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,
se6-4t Board of City Hall Commissioners.

SOMETHING NEW.



Wooden Pipe of all Sizes,

From one to twelve-inch bore, suitable for water or gas, that will stand as much pressure and last as long as iron, for half the cost.

Send for descriptive catalogue and price list to

H. F. WILLIAMS,
11v27-tf 331 Montgomery st., San Francisco.

Nevada Metallurgical Works,

21 First street.....San Francisco.

Ores worked by any process.
Ores sampled.
Assaying in all its branches.
Analysis of Ores, Minerals, Waters, etc.
Plans furnished for the most suitable process for Ores.
Special attention paid to the Mining and Metallurgy of Quicksilver.

E. N. RIOTTE,
C. A. LUCKHARDT,
Mining Engineers and Metallurgists.

KROM'S DRY ORE CONCENTRATOR

Separates the METALLIC ore from the BARREN gangue by means of AIR instead of WATER. Cost nominal; concentration perfect. Every miner and business man interested in this invention which renders the working of low grade and "rebellious" ores PROFITABLE. The machine is in operation daily between 10 and 1, at 105 First street.

For information and pamphlets, address

Menzo Spring, Manufacturer of Dr. Bly's
Patent Artificial Limbs. Office and Address 166 Tehama St., Corner of Third, between Howard and Folsom, San Francisco, California. 11v6-3m

GIANT POWDER.
Patented May 26, 1868.
THE ONLY SAFE BLASTING POWDER IN USE.
GIANT POWDER, NO. 1,
For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.
GIANT POWDER, NO. 2,
For medium and sesmy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.
Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.
☞ The only Blasting Powder used in Europe and the Eastern States.
BANDMANN, NIELSEN & CO.,
20v22-3m16p General Agents, No. 210 Front Street.

W. T. GARRATT & CO.
CITY
Brass and Bell Founder,
Corner Natoma and Fremont Streets,
MANUFACTURERS OF
Brass, Zinc and Anti-Friction or Babbet Meta
CASTINGS,
Church and Steamboat Bells,
TAVERN AND STABLE BELLS, GONGS,
FIRE ENGINES, FORCE AND LIFT PUMPS.
Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles. HYDRAULIC PIPES AND NOZZLES for mining purposes. Iron Steam Pipe furnished with Fittings, etc. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."
☞ Highest Market Price paid for OLD BELLS, COPPER and BRASS. 6-tf
W. T. GARRATT, JAMES HILLMAN, W. T. LITTLE.

N. W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.
Nos. 17 and 19 Fremont Street, near Market.

MANUFACTURER OF
SPAULDING'S
Patent Tooth Circular Saws.
They have proved to be the most durable and economical Saws in the World.
Each Saw is Warranted in every respect.
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Prices.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.
IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found **more economical, advantageous and reliable** than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah. Superintendent's Office, Sept. 26, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

SAN FRANCISCO, SATURDAY, SEPTEMBER 20, 1873.

VOLUME XXVII. Number 12.

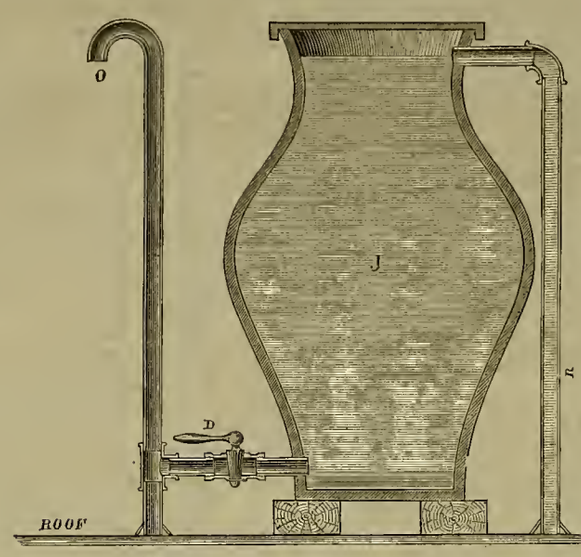
Huerne's Self-Cleaning Filter.

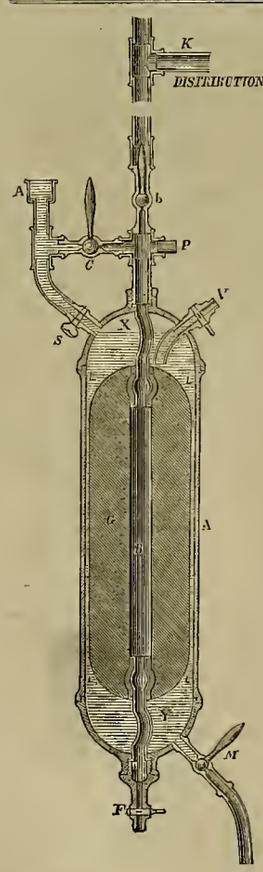
The medical faculty all discourage the use of impure water, as the digestive organs are weakened by the absorption into the system of the impurities always found in common water. These substances are various. Minerals, which, though innocuous in small quantities, when partaken of largely and repeatedly, affect the health, especially of delicate women and children. Extraneous matter, which finds its way into the water of large cities, is drunk in a quantity which would appal the careless observer who saw the dirt collected from the water for the first time. Sacramento water is proverbially impure, and filters are in great demand at that place. In San Francisco the general impression is that the water is free from impurities, and until lately we were of this opinion. We visited several houses recently, in which were placed a peculiar filter, which is attached to the mains, and were surprised to see what an amount of mud and dirt had accumulated in the instrument, even in one day. The filters referred to are cleaned every morning, and the water drawn off from them is peculiarly clear, when compared with that drawn from the pipes in the ordinary manner.

As the subject is one which very much interests this as well as other communities, we have had an engraving made of the filter we refer to, which is shown on this page. It is the invention of Prosper Huerne, of this city, and is quite simple in detail and operation, though a description might appear somewhat complicated.

Thus the water which is admitted into the chamber between the stone and shell, through the pipe, *A*, by means of the cock, *S*, will be forced through the porous stone by the pressure of the water, into the chamber, *B*, from whence it can be drawn for use, through the pipe, *n*; or the cock, *F*, being closed, the pressure will force the water up into the tank, *J*. *X*, is an air chamber which is formed by the water in the upper space *L*, *L*, so that a continuous force is obtained, while the heavy sediment which comes in with the water, settles through the side spaces to the bottom of the lower chamber, *L*, *L*, at *Y*, from whence it can be drawn off through the cock, *M*, and side pipe. *V*, is a vent or air tube to admit and vacuate air. *P*, is a plug which closes an opening in the pipe, *b*, to which the connection of a force pump may be attached in case the water is drawn from a river or creek and is under no pressure. *R*, is an overflow pipe which connects the upper end of the tank with a sewer or other waste way. *O*, is a siphon extension of the pipe, *b*, rising higher than the level of the water in the tank, by which the working of the filter is tested.

A is an elongated circular shell through the upper end of which the pipe, *b*, passes. Inside of this shell is an elongated porous stone or ovoid, *G*, which is shorter than the shell and somewhat smaller in cross section. This ovoid has a hole or passage, *B*, extending longitudinally through its center and is supported in place inside of the shell by the end of the pipe, *b*, being secured in the upper end of the passage. A short pipe, *n*, similar to *b*, is received in the lower end of the passage and passes down through the lower end of the shell, thus fixing the ovoid inside of the shell with a space, *L*, *L*, above and a similar one below, their spaces being connected by the narrow spaces between the shell and the sides of the stone. The pipe, *A*, connects with the supply main and communicates with the interior space, *LL*, at the upper end of the shell, a cock, *S*, serving to regulate the flow. The pipe, *b*, passes directly up to and through the roof of the house where it is connected by a side pipe with a jar or tank, *J*. A short pipe connects the two pipes, *A* and *B*, and a cock, *C*, serves to cut off communication between the two when desired. *K* is a distributing pipe which can be extended to any part of the house.





To work the filter alone, *C*, *b*, *M*, are shut, and *V*, *S*, are opened. Shut the vent, *V*, as soon as the water spouts from the vent pipe, for then the filter is full. The flow is regulated by the cock, *S*, so that no more than two gallons per hour will run. This can be seen by the amount coming out of the pipe, *F*. Then shut the cock, *F*, and open the pipe, *b*, to allow the water to pass up into the jar, *J*. In this operation the water comes in at *S*, to the chamber *L*, *L*, and is forced by the pressure through the stone, *G*, into the hollow chamber, *B*, by which process it is cleansed of all impurities. It either passes out of the pipe, *F*, or if that is closed it passes on up the pipe, *b*, through *D*, into the jar, *J*, from which it can be drawn when desired. It may be allowed to filter and accumulate in the jar, and the overflow pipe, *R*, being connected with the sewer, will carry off the surplus water; or the water can be shut off when it is thought that the jar is full.

To clean the filter when there is pressure upon it, the cocks, *b*, *F*, and *S*, are shut. *M*, and *V*, are opened until what water was in the filter has run out through the waste pipe, *M*. Then the cock, *C*, is opened and the water allowed to run a few minutes. This operation reverses the flow of water. That is, it comes through the pipe, *C*, into the hollow chamber, *B*, and is forced *outward* through the porous stone into the air and mud chambers *L*, *L*, *L*, *L*, carrying with it all sediment and impurities, which may have collected outside of the stone. Whereas, in admitting the water to be filtered it comes through *S*, to the *outside* of the stone and is forced *inward*, being filtered by the stone on its way.

To clean the filter with filtered water when the city water is too dirty and the jar, *J*, is high enough, *C*, *S*, and *F*, are closed and *M* and *V*, opened until the water stops running through the waste pipe, *M*. Then the cock, *b*, is opened until the water runs clear, through the waste pipe, *M*. When the water is extremely muddy, a special tank is added to allow the mud to settle previous to introducing it into the filter. When the water has a bad odor, charcoal or other deodorizer may be placed in this tank.

A great many different styles of filters are now in use, in most of which, however, the sediment accumulates gradually, through which the water has to pass. This water so obtained remains apparently clear, but often contains impurities from the accumulation of dirt in the filter alone. Self-cleaning filters such as the one we describe, are as clear at the end of a year as on the first day they are used; the impurities collected or strained from the water being daily thrown away. This filter can be used every where in large cities, with the pressure usually on city mains. In the country a force pump and tank would be needed. Pure water can be obtained from this filter in sufficient quantities for steam boiler use, which will in a measure prevent the scaling of boilers which inevitably follows the use of impure water, thus saving great inconvenience and expense.

The filter is usually set in the kitchen or pantry where the water can be drawn directly from it; but if desired the filtered water can, with the pressure on the supply pipe be raised to a special tank on the roof and thence distributed through the house. The cleaning is simple and can be performed in a few minutes. Of course it can be allowed to run night and day in larger or smaller quantities to suit the wants of the consumer. The first cost of the machine is the whole expense and that is quite small. Two or three jars can be connected together to increase the reserve of filtered water. The tank should of course be covered to prevent the collection of soot, dust, etc. Mr. Prosper Huerne, the inventor, is a prominent architect of this city and has put a number of these filters into houses of his construction and several others. The filters are made of brass and are quite ornamental. Mr. Huerne has also devised a settling and self-cleaning water tank, for use in localities like Sacramento where the water is under pressure but is muddy. Parties desiring further information on this subject can address the inventor, N. W. corner of Washington and Kearny streets, or E. Hestres, general agent, 202 California street, in this city.

The Utah Mining Swindlers get hauled over the coals occasionally, whether the investigations ever amount to anything or not. We see by a dispatch from Salt Lake that two detectives have arrived in that city from the East, with warrants for the arrest of certain mining swindlers. One of the offenders gave himself up, and went East with one of the officers. The dispatch says that there seems to be a determination among capitalists who have been robbed by bogus mines to arrest and punish the guilty parties. This "determination" may be all very well, but the swindlers generally get off, after all. We frequently hear of swindles, but seldom of the punishment of the perpetrators.

The science of geometry had its rise among the Egyptians, who were, in a manner, compelled to invent it to remedy the confusion which generally happened in their lands from the inundation of the river Nile, which carried away all boundaries and effaced all the limits of their possessions. Thus the invention, which at first consisted in measuring land, that every person might have what belonged to him, was called geometry, or the art of measuring land.

A New Grove of Big Trees, for which California is famous, has been found on the Coulterville route to the Yosemite Valley. The new grove has been named the Merced Grove of Big Trees. It is said to be fully equal to either the Calaveras or Mariposa Groves, and is easy of access, being on a direct line to the Valley. One of the trees is said to be 75 feet in circumference.

CORRESPONDENCE.

Notes of Travel in Utah Territory.

[By our Traveling Correspondent.]

North Star District,

Consisting of North Star and West Camp, is located 36 miles west from Beavsr City, the connty ssat of Bsavsr county, four miles from Bsaver river, and ahont 225 milss south of Salt Laks City. This district was cut off from "Star" district Nov. 11th, 1871. W. H. Lighthall was elected Recordsr at that time, and has filled the position np to the pressnt, heing still in office. The mines of this district are worked principally for silver, although there are sevsral copper mines. The character of tho ores is similar to thoss at Pioche, slightly hase all through, and in some cases smelting orcs are obtained. At Shauntie Springs, some 5 miles from North Star town, in Star district, two furnacss ars erected, one of which is in successfnl opsration now. There have heen soms 500 locations rscorded in North Star district; some fivs companies are working at this writing.

The Town of North Star

Contains ahont 50 inhahitants. This town is pecnliarly situatsd, heing less than 20 miles distant from twelve different mining districts, all of mors or less importance. The principal ones are Star, San Francisco, Prusss, Rocky, Beaver Lake and Lincoln District. The character of the conntry rock here is lime and quartzite, and in one place granite. The ores are of a very high grade, many prospects running into ths thousands. Nearly every different metal kuown is found here, although silver, oopper and lead are the most prominent. The mines of this district that are heing developed, are as follows; the most prominent of which, is the

North Star S. M. Co,.

Limited, of London, Ontario, Canada. It is an incorporation of $1,150,000 capital stock, the principal offics of which, is ae ahove; Lieut. Col. John B. Taylor is Presidsnt; D. C. Bntterfisld Esq., is General Snperintendent, and Dr. A. T. Machattie and T. S. Wills, Esq., ars the resident directors of this corporation. The mines of this company ars at North Star, Beaver county, Utah Territory, and consist of the following locations: Beginning on the southwest of their mines, the first is the Oakland, containing 600 feet; next, Hickory, 1,000 feet; Herrington, 1,000 feet; and the Raineer, containing 1,000 feet; the three former are prohahly one continnous ore-hody, certainly the two former, the Oakland and Hickory are. The ors body of the ahove-mentioned locations runs northeast and southwest, and dips to the northwest, at an angle of ahout 75°, the country rock of which is a hanging wall of lime, and footwall of quartzite. The character of the ore is considered free milling, carbonate in ths main, slightly hase throughout, and in soms small lots very hase.

The Composition of the Ores

Of this company's minss is truly wondsrfnl—ae they contain such a largs combination of minerals. Besides silver, these ores contain lead, galena, iron, copper, arsenic, antimony, sulphur, and a trace of gold. The value psr ton in silver of the ores thus far extracted runs from $8 to $2,000 per ton, and averages ahout $120 per ton, 700 tons of which is now upon this company's dumps. They havs developed the different locations hy some five different shafts, and as many diffsrsnt prospects; their shafts vary in depth from 40 to 180 feet, all showing ore, varying from a few inches to 20 feet wids, and averaging ahout 4 fset in width; drifts have heen run ou the ore hody 150 feet, connecting ths Oakland with the Hickory shaft, at a point in the latter shaft 62 feet helow the surface. At the mines of this company 11 men are employed, hoisting hy wiudlass. These mines are situated at an elevation of ahout 7,000 feet ahove tide watsr. Ahout five milos sast of thsse mines and the town of North Star, this corporation ars erecting a very fine

Ten-Stamp Mill

With a capacity for twenty stamps, the machinery for which was made to order in Chicago, Ill. A majority of the machinery is on the gronnd at this writing—it is expected to he completsd hy the 10th of Octoher, this ysar. It ie located near Beaver Cresk, and at ahont 800 feet less elevation than the mines. The expe:ts of the company estimate some 7,000 tons of ore in sight on their different locations.

There ars several othsr prominent mines here that at present are lying idls. The Osceola No. 1 and 2 have ahout 300 tons of a high grade ore upon their dnmps, and have a shaft down 60 feet. The Blue Cloud has ahont 100 tons upon the dump, and their main shaft is down ahout 70 feet.

The Lake Superior Copper Mine,

Located ahont 1½ miles northwest of the town of North Star, shows croppings 20 feet wide which are prominent for over ¼ of a mile. It is the property of Messrs. W. H. Lighthall, James Forgie and Captain Bates. These gentlemen own 1,000 feet on this lode, that runs northeast hy southwest, ths general course of all ths minss in this district, and pitches to ths northwest. One shaft is down ahont 40 feet; they have ahout 100 tens of ore on dump, 30 tons of which will go ahout 30 per cent. copper and $18.75 per ton in silver.

To ths seuth of the town of North Star there are several prominent mines, idle at present, helonging to Messrs. Jamss Schoonmaker, Collins & Co.

Beaver Lake District

Is situated ahout 10 miles north of North Star, and ahout 3 miles north of the Pioche stage road. There are several locations, among which are ths Big Mountain and San Francisco mines. There is a shaft on ths San Francisco to ths depth of 130 feet, with a good hody of ore that runs from $200 to $300. The Big Monntain has not been worked very much sxcept to strip it. It shows a vein about 800 feet in length, and the ore is said to run from $500 to $900 in silver with a small per cent. of galena. This mine is the property of Messrs. Gray, Dykes & Smeeden, and the San Francisco mine helongs to Camphell & Byrone.

Little Cot'onwood District.

This district comprises all ths mines and locations of every character lying on either side of Littls Cottonwood Cañon, which cañon forms a horseshos in shape, with the toes toward the westward (from which side you enter) and the heel to the eastward. The locations of this district sxtend for a distance of ahout 10 milee east and west aud from 2½ to 5 miles north and south. Through Mr. John McDonald, the present Mining Recorder of this district, I learn that there are ahout 2,100 locations iu the district of Little Cottonwood, and the date of the inauguration of this district, was Aug. 15th, 1868, at which tims Mr. J. F. Woodman was the Mining Recorder. Previous to the ahove dats this district was known as

Mountain Lake Mining District,

And ite boundaries extendsd north and took in "Big Cottonwood Mining District," at present cut off hy itself. Mr. R. Greenway is the present Mining Recorder of that district. It also run south and took in the Americau Fork District, of which Dr. Spoerry is the Rccorder. From the center of Littls Cottonwood district to the line of Big Cottonwood is from 1¼ to 2½ miles, and to that of American Fork district it is from 2 to 5 miles, at or near the center of the present principal development of Little Cottonwood, and around which are centered all the mines of importance that ars at all developed.

Alta City,

Which hegan its existence in ths year 1871, contains (with its surroundings) about 1,500 inhahitants, ahont 600 of whom are miuers, working for wages, hesidss others prospecting for themselves. The town has one hotel, kept hy S. Fuller; hoard and lodging $3 per day. At ths resturants, half a dozen in number, meals ars from 50 to 75 cents. There are 5 or 6 mercantils houses, and twice as many saloone. This place is located ahout 29 milcs southeast of Salt Lake City, in Salt Lake county, Utah Territory, at an elevation of 8,480 feet ahove the level of the sea, or ahout twice as high as Salt Lake. Ths winter commences here ahout the 1st of Novemher, and lasts until the following June; the snow falling from 15 to 18 feet deep on the level, although it drifte and slides to a depth of from 40 to 100 feet. The monntains surrounding Alta City, and forming bonndaries of the Littlo Cottonwood district, are on the north 10,000 feet; on the east 10,500 feet, and on the south 11,000 feet elsvation, ahove tide water.

How to Get There.

From San Francisco, Cal., to Ogden, it is 881 miles, via ths C. P. R. R., and the fare $50 coin; from there to Salt Lake city, Utah Territory, running nearly south it is 38 miles via the Utah Central R. R., and costs for fare $2 currency. From Salt Lake City still going south, via the Utah Southern R. R., it is 12 miles to Sandy Station, and the fare $1 in currency, at which point you take the Wasatch and Jordan Valley R. R., (narrow gange) to Granite, a distance of ahout 7 miles; fare 75 cents. At this poiut you take stage or horseback travel for Alta City, distance 10 miles. This portion of the travel ie run hy Parlin & Thompson; fars hy the etage $2.50. Total distance from San Francisco 958 miles, and cost of trip $56.25.

The Principal Mines

Of this district are as follows, together with their aggregate ore-producing capacity daily: The "Flag Staff" 100 tons; the Emma, 30 tons; the Davenport 25 tons; Windsor 20 tons; Vallejo 15 tons; Highland Chief 10 ton ; Wellington 8 tons, and City Rock ahout 5 tons daily; and from miscellaneous mines, aggregating 75 tons more every 24 hours. The ores of this district are hase carhonates or smelting ores. The ore hodies run nearly northwest and southeast; and pitch northeast, at angles varying from 40° to 50°. But as ths ore is found principally in great hunches, or kidney-shaped deposits, their general pitch is not definable. The country rock is limestone principally.

Additional Prominent Mines

Of this district, not at this writiug shipping ore, are the Oxford and Geneva, located two miles southwest of Alta City. This company have ahout 400 tons of good ore now on their dumps. It is located on what is here known as Peruvian Hill. They ars now making a wagon road to this mine. The Titus Mine is on Emma Hill, to the north of Alta City. Thsy have out on their dumps ahout 500 tens ready for shipment. The Grizzly Mine, now lying idle, (considsred the finest mine in this district,) is in litigatien, thsrefore no infermation of value can he procnrsd from that quarter, although they can at any time they see fit ship 50 tons of ors daily. The latter mentioned mins, together with ths City Rock, Davenport, etc., on Davsnport Hill, are considered trus carhonate ores; while those of ths Flagstaff, Emma, Vallejo, etc., are galena ores. The latter mentioned run from $80 to $125 psr ton in silver, and from 40 to 50 per ceut. lsad. Those on Davsnport Hill, ahovs mentioned, run from $100 to $225 per ton in silver, and from 35 to 48 psr csnt. "hass."

The Smelting Works

Of the Flagstaff and the Davenport ars at Granite, 10 miles down the Cottonwood Cañon to the wsst, to which point all the ores of this district ars transported on wagons, at a cost of $7 per ton; from there the ores that aro not reducsd here ars reshipped to Sandy Station, Salt Laks City, etc., for reduction.

Sandy Station and its Smelting Furnaces.

Sandy Station is 12 miles south of Salt Lake City, on the Utah S. R. R., at the junction of the Wasatch and Jordan Valley R. R. It is the point of vergence from the U. S. R. R. for Littls Cottonwood on the east, and to Bingham Cañon on ths west. Saudy is midway between Cottonwood and Bingham, heing 17 miles from either place, and contains ahout 250 iuhahitants. Its importancs, outsids of the husiness connected with the three smelting furnaces, is not worth mentioning.

The Last Chance Furnace

Or smelting works is ¼ of a mile east of Sandy Station, and is owned hy a London incorporation, known as the Last Chance Mining Co., of Utah (Limited). The mines connected with this company are in Bingham Cañon; Mr. F. H. Meyers is Supt. of the works. This furnacs is run hy steam, with an engine of 30 horse power; it contains two furnaces that have a capacity of reducing 50 tons of ore every 24 hours, producing 10 tons of hullion, the value of which will average as follows: To every ton of lead valued at $85, there are ahout 150 ozs. of silver and 50 in gold; this company are smploying 40 men regularly.

Saturn Smelting Works,

Locatsd ¼ of a mile eouth of Sandy Station, is the property of the "Saturn Silver M. Co," (Limited) of London. The mines of this company are at Bingham, some 17 miles to the westward. Thess works ars run hy steam, with sngius of 50 horse power, (two hoilers). It contains 2 water jacket furnacss, and one hick furnace; these three furnaces have a capacity of reducing 90 tons of ors daily (24 hours); 2⅓ tons of this ore produces ous ton of hullion—to every ton of hnllion thoy get from 237 to 250 onnces of silver, and from 10 to 11 ounces of gold, the lead running from $84 to $95 per ton. Each of the above mentioned furnaces consume daily from 750 to 900 hushels of charcoal, and from 1⅓ to 2 tons of coke, and ahout 5 tons of fluxes, consisting of iron ore and limestone, they employing regularly 50 men at the estahlishment. The manager of the ahove incorporation is Mr. J. B. Stanford, T. E. Clohecy, Cashier; J. F. Crossett, Superintendent; Professor Norton, Assayer. E. M. Wilson, Esq., Clerk. Ths

Mountain Chief Smelting Works,

Adjoining the Saturn Works, is the property of the "Mountain Chief Silver M. Co.," the principal mines of which are at "Dry Cañon," although they havs interests at Bingham. Dry Cañon is some 40 miles sonthwest of Sandy Station, from which point their ore is transported in wagons at a cost of $15 per ton. These works have one furnace (Water Jacket) and one in course of erection. The capacity of this one furnace is 30 tons of ore daily (24 hours), producing ahout 10 tons of hullion, of ahont the same valus of the hullion prodnced hy the Saturn, also using ahout the same amonnt of fnel and finxes, working regularly 15 men; S. W. Valentine, ResidentManager in Salt Lake, and A Hanawer, Superintendent. From Bingham Cañon in my next.

L. P. Mc.

[To be continued.]

TWENTY-OUNCE DIGGINGS.— William Wittie and Dr. Joseph Holdsworth, of this city, returned this morning from a prospecting trip to the north of Wehher Lake. Wittie and a party of prospectors were up in the same region last May, and, while they found hoth gold and silver-hearing quartz, they were not succeesful in striking any ledge of extraordinary richness. This time, however, Wittie and his companion extended their explorations from Nevada to Sierra counties, and on the Middle Fork of the Yuha river thsy struck some gold-hearing ledges of great richness. One silver-hearing ledge was fonnd, hut the ore was not of high grade and but little importance was attaehed to it. The nsw mines are in Nevada county, and while our Virginia prospectors were at work in there; a man come over from Sierra City and struck a lead of decomposed quartz from which he took out twenty ounces of pure gold in one day. The entire population of Sierra City (the mau who found the ledge and his partner) were very much excited over the new strike.—*Virginia Chronicle.*

The Alaska Mines.

The Portland (O.) *Bulletin*, in spsaking of the arrival of the steamer "Gussie Telfair," from Sitka, says that she hrings vsry impertant news from Alaska, which, if trne in every detail, will revolutionize the prssent condition of our northern possessions. Pnrser Goodhns reports intsnse sxcitemsnt prevailing in Sitka over ths quartz-mines recently discovered in ths vicinity. The minss discovsred a fsw months ago hy Holey ars prospecting wsll; ths steamer hrought down two tons of it which are to he forwarded to San Francisco to he assaysd. The same person has also discovered a quartz mine which is said to hs exceedingly rich; the gold, it is said, can he picked out with a knife. Everyhody in that region talks of nothing now hut mines, and all are speculating in them.

Great as is the excitement at thie place, it is much greater at Forts Wrangel and Tongos, as placer mines have heen discovered about 245 miles from Fort Wrangle, and they ars sa'd to he exceedingly rich. The diggings are situated on a creek that empties into a lake ahout 70 miles from ths Stickeen River. This would place thsm at ahout 80 miles from ths head of hoat navigation on the latter. They were first discovered hy a man last winter, and he came hack for provisions to enable him to work them, hut on returning he was frozen to death.

They are worked now hy twenty-thrse miners, and they maks from one to four ounces per diem to the hand. The diggings are situated on a slate rock hed, and in some places they are so rich that the miners take the gold out of crevices hy the epoonful. Their extent is not yet known, hnt they are supposed to he quite lasting.

Purser Goodhue showed us some of the metal. It is coarse shot gold, and some pieces are worth from two to twelvs dollars. This gentleman hrought forty ounces of it to parties in Victoria, and it was deemed hy them to be of excelleut quality.

If these mines shonld hold out for any length of time it will indicate that the auriferous material ie very ahundant in that region, and it will, of course, lure there a large number of adventurous and enterprising miners and merchants, and that couutry, which is now a mere wildernsss, will, as a consequence, be densely populated.

Prevention of Waste in Manufacture.

In the economy of trade and manufactnrss, there is nothing more interesting than ths prevention of waste, or the discovery of a way hy which waste materials may he turned to profitahle uses. A remarkahle case in point hae rscently ocenrred. In the manufacture of the beautiful hlue and violet dyes that make silken textures and the wearers thereof look so hsautiful, there has always heen produced a large quantity of a dark colored suhstanes, known among chemists as "Hoffman's gum." In some aniline dye-works, ths accnmulation of this refuse amounts to hnndrsds of tons, and has long heen a hideous burden. But recently Mr. J. Spiller, a member of ths Chemical Society, has discovered that hy the process which chemists describe ae "destructive dietillation," blue and violet dyes, quite ae good as thoss extracted in the first instance, can hs got out of this waste gum; and so, as if hy magic, the hideous heaps now lying in the outskirts of many chemical works in this country and on the continent hecome valuahle as gold mines, and enterprising chemists reap the reward.

Another instance is rsported from Cornwall. The drainage of certain mines thers is discharged from a great adit, and flowe into the sea. A few enterprising individuals rented a piece of waste land at the outfall, dug a few catch-pits, into which the water poured, and threw down a sediment ers it finally escaped. This sediment is ochre, useful for paint and many other purposes, and the quantity collected in this simple way in one year was ahont two thousand tons, worth from eleven to twenty-five shillings a ton. These economisers, however, have let some of their profit slip, for a keen contriver dug a pit to intercept their waste water, and in the same year got three hundred pounds' worth of ochre as the reward of *his* ingennity. One more example comes to ue from southern Italy, whers the people squeeze oil from olives in common wooden presses, and hurn the huskeas fuel. A Frenchman from Marseilles went among thsm, and hought the husks at tweuty francs a ton; shipped them to France, where, after treating them chemically, he squeezed them in a stsam press, and extracted therefrom twenty per cent. of oil.

COLOSSAL DAM.—In a former issue of the *National*, ws made mention of the colossal work which is heing done at Little Long Valley ahove Rush creek in this county, hy ths Providence Hill Mining Company. Under the ahle management of C. W. Reed, the work on the great dam is actively progressing. When completed this structure will be the most colossal work of its kind in California. The dam will be a timhered crih work, 600 feet in length, 80 feet in width at the hettom, with a hight at the center of 40 feet. By this great obstruction to the creek, Little Long Valley will he transformed into a respectably sized lake. The water from this hig re.ervoir is to be us d upon the rich placers at Providence Hill on Rush Creek.—*Plumas National.*

Scientific Progress.

The Heat of the Moon.

The Earl of Rosse has shown by experiments that the moon not only reflects heat to the earth, bnt that she gives out heat hy which she has been heiself warmed. The distiuction may not perhaps appear clear at first sight to every reader, but it may easily he explained and illnstrated. If on a bright snmmer's day we take a piece of smooth, hut not to well polished metal, and by means of it reflect the snn's light upon the face, a sensatiou of heat will be experienced; this is reflected sun-heat; bnt if we wait while so holding the metal until the plate has become qnite hot under the solar rays we shall recognize a sensation of heat from the near proximity of the plate to the face, even when the plate is so held as uot to reflect sun-heat. We can in succession try, first reflected heat alone, before the metal has grown hot; next, the heat which the metal gives ont of itself when warmed by the sun's rays; and lastly, the two kinds of heat together, when the metal is caused to reflect sun-heat, and also (being held near the face) to give ont a sensible qnantity of its owu warmth. What Lord Rosse has done has been to show that the full moon sends earthwards both kinds of heat; she reflects solar heat just as she reflects solar light, and she also gives out the heat by which her own snrface has been warmed.

It may perhaps occur to the reader how much heat we actually obtain from the full moon. There is a simple way of viewing the matter. If the fnll moon were exactly as hot as boiling water, we should receive from her just as much heat (leaving the effect of our atmosphere out of accennt) as we should receive from a small globe as hot as boiling water, and at such a distance as to look jnst as large as the moou does, or a disk of metal would serve equally well. Now, the experiment may be easily tried. A brouze half-penny is exactly one inch in diameter, and as the moon's average distance is 111 times her own diameter, a half-penuy at a distance of 111 inches, or three yards and three inches, looks jnst as large as the moon. Now lst a half-penny be put iu boiling water for a while, so that it becomes as hot as the water; then that coin taken quickly and set three yards from the observer will give out, for the few moments that its heat remains appreciably that of boiling water, as much heat to the observer as he receives from the full moon supposed to be as hot as boiliug water. Or a globe of thin metal, an inch in diameter and full of water at boiling heat, would serve as a more constant artificial moon in respect of heat supply. It need not be tbought remarkable, then, if the heat given out by the fnll moon is not easily measnred, or even recoguized. Imagine how little the cold of a winter's day wonld be relieved by the presence, in a room not otherwise warmed, of a one inch-globe of boiling water, three yards away! And hy the way, we are here reminded of an estimate by Prof. C. P. Smyth, resulting from observations made on the moon's heat during his Teneriffic experiments. He found the heat equal to that emitted by the hand at a distance of three feet.—*Spectator.*

Annealing.—The change produeed by annealing is not well understood. Most of the malleable metals assnme two distinct forms: one crystalline, which is the resnlt of slow cooling, and the other fibrous, which is brought ab out by hammering or rolliug. If hammered or rolled beyond a certain point, the metals become so hard that they cannot be bent without breaking. If annealed beyoud a certain point, the metals become crystalline. Thus, zinc may be drawn into a very flexible and tenacions wire; but if kept in boiling water too long it resumes its original brittleness, and displays a crystalline appearance when broken. The particlee of the metal change their arrangement without altering the external form, and this change may be brought about in various ways; thus, brass wire loses its tenacity by exposure to the fnmes of an acid, and even by air acting on its surface in a damp atmosphere. Hence it ie necessary to preeerve wire, such as is used in the manufacture of pins, in a dry air, or nnder the surface of water.

Aconnino to *Harper's Weekly*, the United States Signal Corps has recently extended its series of observations to include a daily record of the surface and bottom temperature of the rivers and harbore on which its several stations are situated. These obeervations are not only in a meterological point of view, hut as they are also of great practical importance in connection with the intnoduction of usefnl food-fishes into the rivere and lakes of the United States, a work which is now being energetically pushed forward nnder the snpervision of Professor Baird, United Statee Commissioner.

Lunar Light Upon Vegetation.—Mons. Pierre Charbonnier, in a communication to the *Journal d'Agriculture Pratique*, states that lunar light exerts a material influence upon aquatic vegetation. This fact wae first noticed from the increased growth of cryptogramic vegetation upon the sides of an aquarium. It was observed that during the time of the full moon it was much more luxuriant than during the time of the new moon. This led to other observatione with regard to it, and it was found that aquatic vegetation geuerally is affected in a similar manner.

The Origin of Meteors and Comets.

Proctor has recently advanced an idea as to the origin of comets and meteors that may seem to be hut the revival of an old opinion, and one supposed to have been exploded. The researches of Schiaparelli and Newton and others, in that they showed the meteors to he regular members of the solar system, seems to have temporarily satisfied the inquiry as to the remote origin of these bodies. The former astronomer assnmes them to exist generally throughout the interstellar spaces, and to he successfully drawn to one and then to another sun, while Proctor reasons that these bodies are now found to travel in groups or streams, that it is difficult to conceive how our sun could draw a connected stream of meteors to itself at any given epoch, and that if these bodies were dejected from the self-lumiuous stars, we may with equal plausibility suppose similar bodies have been ejected from the planets of our own system when they were in a molten condition. He accordingly shows the very moderate degree of force required to eject a meteor from the surface of the outer planets, and examines the orbits of snch periodical comets and meteors as are at present known. In accordance with the suggestion of A. S. Herschel, he deduces the interesting conclnsion that the comets expelled from Jupiter would mostly have a direct motiou, or one in the same directiou as his own, while those ejected from Neptune would be as likely to have a retrograde as a direct motion. Proctor concludes that many comets have sprung from Jupiter and Neptune, and at least one from Uranus—the latter being the well-known November meteor streams, or the Leouides, which Hind has shown to he connected with Tempel's comet.—*Harper's.*

Making Mistakes.—Professor Joy remarks: "If Liebig was hasty in expressing an opinion, he was equally ready to retract when convinced that it was erroneous. I once had a conversation with him on this point, and he spoke of the fear some scientific men had of being canght in a mistake. He considered errors inevitable and inssparable from the accomplishment of any scieutific work; and it was on this occasion that he made the oft-quoted remark, 'Show me the man who makes no mistakes, and I will prove to you that he does nothing.' It is easy enough for a scientific man who publishes nothing, but only criticises others, to escape the charge of committing errors, and for such persons Liebig entertained a wholesome contempt. What he desired, above all things, to know, was the truth; and when he thonght he had discovered it, he was anxious to give the benefit of it to the world."

One of the most important discoveries in economic geology made during the past year is that of tin in Australia. Tin has been met with heretofore in Australia, but the recent discoveries indicate far richer deposits than any before known there. The district in which the metal is found is along the valley of the MacIntyre River, on the nigh plateau of the Australian Alps. The ore occurs, as usual, in granite, and so disseminated as to form a kind of stockwork. The overlying surface deposits contain large quantities of oxide of tin, and it is probable that a very large amount of ore will be obtained from the diggings or washings. In a series of trials recently made 20 pounds of detritus were found to yield from three ounces to two pounds of ore. The tin-bearing belt is known to have more than 150 miles of linear extent so that these new mines may, in time, become quite as productive as those of Banca or Cornwall.

Test for Sewage in Water.—At a recent meeting of the Royal Dublin Society, Dr. Reynolds called attention to Heisch's test for detecting sewage contamination. It is one of the best known, but has been strangely neglected. About half a pint of the water to be examined should be placed in a colorless, glass-stoppered bottle, and a few grains of the best loaf sugar added. The bottle should then be placed in a position where it will be directly exposed to the rays of the sun. The liquid should not become turbid even on a week or ten days' exposure. If there is a perceptible cloudiness, sewage contaminated may be strongly suspected. Frankland has stated that this turbidity is due to phosphoric acid present in sewage, and it has also been suggested that it is due to fungoid growths.

An Article on the determination of oxygen in decarbonized Bessemer metal, prior to the addition of speigeleisen, by A. Bender, appears in a recent number of the *Berg-und Huettennaennische Zeitung*. The oxygen ie determined in a sample by combustion with hydrogen to water, and collecting this in a chloride of calcium tnbe. The author thinks the bubbles in Beesemer steel could be avoided if some substance could be found to unite with the oxygen to form an easily soluble slag instead of gas, as it is at present when united with carbon.

A New Red Coloring Material From Anilin.—By treating analin with a few drops of chloride of snlphur, a red and solid product is obtained. Treating this with acetic acid there is obtained by filtration and evaporation a brilliant black product.

Old Probabilities seem rather satisfied with himself than otherwise, that he has hit the weather for the past twelve months sixty-nine times out of one hundred.

Mechanical Progress.

Utilization of Furnace Slag.

If the following from the Manchester *Daily Chronicle* is correct, it points to results of the highest importance to the manufacturers of iron, in not only ridding themselves of what has always been an embarrassment to dispose of, hut of converting it into a source of profit. Discussing the component parts of the utilizatiou of the furnace slag, the *Chronicle* says:

"Meanwhile, practical men are pretty generally agreed that refuse slag has all the elements necessary to its applicatiou to purposes of high commercial utility. Instead of being simply used for making roads or filling up holes and gullies—for it serves no more useful ends at present—we may soon see it superseding the labors of the quarry, rivaling the most valuable marble, and equalling in beauty and brilliancy the attractive malachise or such precious stones as the agate and jasper. For according to the treatment it receives, slag can be rendered brittle or tough, hard or soft, compact or porous, rough or smooth. It can be cast into as great a variety of forms, both solid and hollow, as iron itself, while it posses the superior advantage of being susceptible of the admixture and blending of colors. Indeed, one gentleman has even stated as the result of his experiment, that this dispised and now useless product can be made, when properly annealed, to acquire a surface of texture at least ten times as durable as marble and is susceptible of a polish equal to agate or cornelian. If all this is possible—and we do not put it forward as mere speculation or theory—then it is surely a scandalous thing that 4,000,000 tons of slag should annually be thrown out as rubbish, at an immense sacrifice of labor and capital, between the Tees and the Tyne."

A New Ice-Machine.—In this warm weather the description of a new ice-machine may not seem unseasonable. According to the *Arbeitgeber*, M. Toselli, of Paris, has invented such a machine, of entirely original construction. It consists of a wheel formed hy a spiral tube. The spiral is open at one end, and communicates with a vessel of water. The other end of the spiral empties into the hollow axis of the wheel, and from this latter communication is had, through a tube, with a worm, which is placed in a cooler. The worm finally empties into the vessel in which the spiral revolves. A blower is also attached, which blews air upon both sides of the spiral. When the spiral is revolved, it takes up water, after the manner of Archimedes' screw, and forces it a long distance through the cooled worm back into the reservoir. The outside of the spiral, being half the time under water, is always wet, and the wind blown over it evaporates this moisture, and thus abstracts the heat from the water in the coil.

The largest anvil in the world has just been cast at Woolwich, England. The plate which is to form the bed of the monster weighs of itself 107 tons. The surface lay face downward, and when it became cool it took a perfect army of sturdy smiths, with hydraulic jacks and a combination of the strongest tackle, a whole day to lift the monstrous lump of solid metal, twenty-two feet square. The anvil block to be mounted thereupon will weigh only a trifle short of 200 tons, and the steam-hammer which will strike upon it thirty-five tons of solid metal, being the English tou of 2,240 pounds. The blow at full force will be tremendous. In fact, it is doubtful what will happen to the town of Woolwich and vicinity when the mighty piece of mechanism gets to work. Vulcan himself, and all the giants who worked beneath Mount Ætna, never dreamt of such an anvil as this; and Thor's famous weapon was a mere tack-bammer in comparison. Taking all its metal together, it will weigh hard upon 500 tons.

A Fire-proof stove for use in passenger cars especially, was subject to a severe test in Boston, recently. The stove is made of wrought and malleable iron. It is circular in form, composed of three upright cylinders and two cold air boxes at the bottom. The fuel is placed in the inner cylinder. The cold air rushing through the cold air boxee drives hot air outward and upward through the cylinders, the rounded form giving a very powerful radiation. The heat escapce through a register in the back. The whole is strongly bound together by strong iron bolts. The doors are fastened by patent locks. At the trial the stove, after the fire in it was well under way, was thrown from the staging upon which it was placed, to the ground a distance of six feet. It was then rolled about, tumbled over and over, but not a spark of the fire was spilled upon the shavings which were scattered around. When the stove-door wae opened the fire was burning briskly. This ingenious apparatus was invented and manufactnred in Wilmington, Del.

Between Glyndon and Crookston, Minn., on the Northern Pacific Road, wind hae been successfully tried as a motive power. On occasion of a land sale at Oak lake, a Crookston party shoved a box-car on the main track, hoisted a sail and sailed themselves through to Glynden, 75 miles in nine houre,

Mr. Bessemer's Channel Steamship.

The construction of the Bessemer saloon steamship has been inspected during the past month at the Hull Shipbuilding Yards of Earle Shipbuilding and Engineering Company, by an infinential deputation from the Bessemer Saloon Steamship Company. The framing of the ship is nearly complete, and the larger portion of the outer plating is worked upon it so that a very good idea of the outlines, at least, of the ship was presented. The Bessemer steamer is 350 feet long, 40 feet broad inside of her paddle boxes, and of 2,774 tons burden, B. M. She will be driven by two sets of paddle wheel engines, acting upon a double set of paddle wheels, situated 100 feet apart, the aggregate power of the engines being no less than 4,600 I.H.P. Although the ship was ordered less than five months ago, the progress above indicated has already been made, and it is now obvious from an inspection of the vessel, even in her present condition, that she will be one of the most remarkable examples of novelty in steam navigation that the world has ever seen. The two ends of the ship alike will be furnished with rudders. It will be in the center of the ship, however, that its most characteristic feature will be found, for here will be placed her saloon, which will be 70 feet long and 30 feet wide, and suspended upon massive pivots at the center and at the extremities. Thus supported, it will be brought under the control of powerful hydraulic gear, worked by the principle boilers of the ship. Their gear will be so arranged that it is expected a man will be able to impart to the saloon a rolling motion in relation to the ship precisely the reverse of that which the ship herself receives. The engine, it is anticipated, will drive the vessel at a speed exceeding 20 miles an hour.—*Iron Age.*

Improved Steam Rock-Drill.—An improved rock-drill, the invention of Mr. Ingersoll, is at present working most satisfactorily at New York. It is stated that a 3½-inch hole was carried down at the rate 2⅔ inches per minnte, and that in boring a 1¼-inch hole the drill penetrated with as great rapidity as would a 1¼-inch auger in hard wood in the hands of a skillful carpenter. The entire drill is supported on three legs, movable like the legs of a surveyer's triped, and joined se as to facilitate its adaptation on uneven grouud. Upon the legs are placed cast-iron weights, which give a steadiness to the whole arrangement, though from the fact that the shock of the blew does not come at all upon the cylinder and its connections, the vibration of the drill is not severe. The mechanical arrangement of the drill is very simple, consisting of an ordinary steam-cylinder to the piston, in which the drill is attached. Every portion of the machine is made exceedingly strong, and the whole is so well balanced that there is very little dangar of unequal strains and deficient power of resistance. The piston is well cushioned with air or steam at the end of the stroke, and the general result has been that the drills have gone on for weeks and months without requiring repairs. There are new about 200 of the drills in operation.

Hail Columbia!—The cotton-gin, without which the machine-spinner and the power-loom would he helpless, is American. The power-shuttle, which permits an unlimited enlargement of the breadth of the web, is American. The planing machine is American. Navigation by steam is American. The mower and reaper are American. The rotary printing presses are American. The hot-air engine is American. The sewing-machine is American. The machine manufacture of wool cards is American. The whole india-rubber industry is American. The hand-saw originated, we believe, in America. The machine manufacture of horseshees is American. The sand-blast, of which the large capabilities are yet to be developed, is American. The gauge-lathe is American. The only successful composing maebine for printere ie American. The grain elevater is an American invention. The artificial manufacture of ice was originally invented by Professeor A. S. Twining, an American. The electro-magnet was invented, and immediately after its invention was first practically applied in transmitting telegraphic signals by Professor Joseph Henry, an American. The telegraphic instrument introduced a few years later into public use, which has since obtained universal acceptance, was invented by Samuel F. B. Morse, an American.

Gas Pokers.—Various fire kindlers, such as cakes of rosin and sawdust, etc., have been introduced, and found very serviceable; but the latest and most original effort in this direction ie a "gas poker;" simply a hollow iron tube, shaped like a poker, with perforated holes in one extremity, and the other arranged with a flexible tube, of sufficient length to connect the "poker," when thrust into the stove or grate, with the nearest gas burner. This done a match will light the gas, and in a few minutes you have a fire, whether of wood or coal, without any trouble or litter.

Within the last year book-sewing machines have been successfully introduced in America, which effect an average saving of one-half the cost of hand-sewing, and are simple and perfect in their operation.

Weekly Variations in Stocks.

An extensive undergronnd survey is to be made for the purpose of determining the boundary line hetweeu the Belcher and Crowu Point mines. It will he rememhered that the Crown Point Company claim that the Belcher Compauy have worked upou their gronud a distance of several feet at one poiut.

Scarcity of Water is reducing the capacity of the mills on Carson River, and is lesseoing the bullion production of the Comstock mines.

Base Bullion from Utah minss cannot be profitably shipped under the new railroad tariff, and unless a modification of rates can be secured, with regard to this particular class of freight, the effect will he to cripple, if not to ruin, this branch of miniog iudustry.

The latest reports from the new coal mine, ten milcs below Deer Lodge, Montana, are that the vein has increased in thickness, being now about thirty feet, and the quality is everything that could be desired.

Our Weekly Stock Review.

Thursday Eve., Sept. 18, 1873.

The Stock Market, during the past week, hae besn lively, but has fluctuated up and down in a rather remarkable manner. Ophir has been the feature of this week as it was last. Everybody wants the Ophir to turn out to bs a good mine, but the public do not know whether the advices from tusre are correct or not. Anything regarding the mine is seizsd upon with avidity by operators, and it has, to a great extent, influenced the markst prics of other descriptions of stock. Ths assaye of ors are getting higher in gold. The Superintendent'e report for the week ending Sept. 10th, says:

"Cross-cut from winzs, south mine, seccud station, 88 feet; south drift, 1300-foot station, 158 feet; south drift, 1465-foot station, 62 feet; west drift, 1700-foot station, 23 feet. Assays from 1300 continus ths same as previonsly rsported, ranging from $10 to $80—gold predominating. Quartz in south drift, 1465, is incrsasing in qnantity and better defined. Have also a slight improvemsnt in character ot quartz on 1700-level."

The letter of ths 13th inst. says:

"South drift, 1300-foot lcvel, is progressing well, with a slight improvement, assays averaging about $30 per tou. This drift is being run along ths foot-wall of ths ledge. The better, or richer, portion should be toward the hanging wall. When we have attained 25 feet further southward ws will cross-cut and see what ws have at this poiut.

We still have about 280 feet to drift before reaching eouth lins. The 1565-foot levcl coutinues to show more quartz, aod of better quality as the drift progrssses. Assays are still low, but improve slowly. No change on ths 1700-foot levsl."

The Raymond and Ely shipped on ths 15th $35,025 or a total of $100,184 for the month that far. Total hullion product of August wae $204,448.

Ths hullion returue from the Belcher this month will be lese than usual by reasou of ths low stage of water in ths Carson River. The Pioche *Record*, in spsaking of affairs iu that camp, says:

About this tims last month many meu wsre bsiug set to work in differsnt miues, but on the other hand, within the last few days a good many havs been discharged. A few are leaving Pioche, and many talk of leaving. If all ths surplus men would leave, thus obliging ths companies to seek for workmen instead of the workmen being obliged to seek for employment, ths camp would be a far better ous in respect to business at leaet. We think that such a etate of affairs would also causs more mines to bs developed; for business being then in a sound condition, many bnsiness men who are now cramped with regard to money matters, could afford to aid in ths dsvelopment of uew miues, which no outside capital can be inducsd to invest in.

Ths Minnesota mine shippsd $6,478 on the 10th inst.

The Golden Chariot extracted in Augnst 785 tons; redneed 103¾ tons; bullion produced $74,690.68; yield per ton $106.14; pulp assay $132.22; tailings' assay $16.46; percsntage of assay obtained 80.27; production $74,690.60; expensss $22,105.77; profit $52,584.91

The marksd advancss in prics over prices of last week are as follows; Alpha Consolidated, $2; American Flat, $2; Baltimore Cons., $1.25; Best & Belcher, $1.25; Chollar-Potosi, $4; Cons. G. H. Quartz, $2.25; Cons. Virginia, $3; Savage, $15; Ssg. Bslchsr, $1; Meadow Valley; $2; Newark, $1.50; Goldsn Chariot, $3.50; War Eagle, $2.

The declines are as follows: Belcher, $1.50; Caledonia, $3.75; Confidence, 1.25; Crown Point, $2; Knickerbocker, $5.50; Ophir, $2; Silver Hill, $1; Raymond & Ely, $1.

One of the Lost Arte.—Ths new discoveries in Egypt will add plausibility to Wendell Phillips' lscture on "The Lost Arte." It now appeare that the smelting of iron was carried on in Egypt from ths vsry earlieet period. Charles Vincent, in an English scientific jonrnal, sets forth some nsw facts in reference to this subject: "In the sepulchres of Thebes may bs fouud delinsations of bntchere sharpeniog their knives on rondd bars of iron attached to their aprone. The blades of the knivee ars painted blue, which fact provse that they wsre of steel, for in the tomb of Rameses III. this color is used to indicats steel, bronzs bsiog represented hy red. An Eoglish gentleman has recently discovered near the wells of Moees, by the Red Sea, the remains of iron works so vast that they must have employed thonsands of workmen. Near the works are to be found the ruins of a temple and a barrack for the soldiere protecting or kceping in order the workmen. These works are supposed to be at least 3,600 years old."

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALPINE COUNTY.

A "SILVER BRICK."—Alpine *Chronicle*, Sept. 6: On Monday last, Superintendent Hunter, of the Schenectady Mill, worked 2,871 pounds of ore from the Pennsylvania mine at Silver Mountain, and obtained therefrom a golden-silver "brick" worth $43.42 in gold, and $33.10 in silver—making a total value of $76.52. This ore was worked by common mill process, and the result has exceeded the expectations of the stockholders, who did not suppose that the ore carried so much gold. We have always had faith in the Pennsylvania claim, and in the hands of capitalists with a mill at the mine, we are confident it would prove a very remunerative mine. We congratulate the patient stockholders on this gratifying result.

AMADOR COUNTY.

PHŒNIX MINE.—Sutter Creek *Independent*, September 10: The work at this mine is being prosecuted to great advantage. The rock now being taken out looks exceedingly well and is of a firm and steady class. It is becoming richer the deeper the company go upon the lead. On the lower levels the foot walls are very firm and the hanging walls could not be finer. Superintendent Hooper has proved himself a master of his business. The Phœnix bids fair to become one of the richest mines in the county.

RIVER MINES.—September 12: Now that the water in the Mokelumne river is quite low, miners about Lancha Plana are taking advantage of the situation and working several bars successfully. We are told that many of these river claims are fully as rich now as they were years ago. The gold is of a fine quality, and many pockets are found that contain much of the precious ore. Lancha Plana has been one of the richest mining camps in the county, but for want of water of late years has become comparatively deserted.

VOLCANO.—A friend informs us that the mines in and about this place are all being worked to advantage, and are paying well. Though the supply of water is rather short, yet a sufficiency is had to run about ten hours a day.

CALAVERAS COUNTY.

RAILROAD FLAT DISTRICT.—Calaveras *Chronicle*, September 13: The Sanderson mine never looked better than to-day. The main shaft is down 170 ft. and ore in bottom is 18 inches thick containing considerable gold.

MOSQUITO DISTRICT.—The Good hope is developing finely. It is rumored that the owners of the Good Hope have purchased the Dolly Varden, one of the best mining properties in the district....Quite a number of other mines are energetically worked with encouraging results.

WEST POINT DISTRICT.—The south level of the Zacatero continues to yield first-class ore....A new and large working shaft is to be sunk on the east vein of the Ohio Consolidated....Griggs & Co. and W. Henry & Co. are pushing ahead their respective tunnels....The Good Faith Mining Co. are sinking a handsome and substantial shaft on one of their veins. Down 45 ft. The shaft will strike ore at 80 ft. in depth. This company are doing the cheapest and best work in the district... The water is being pumped out of the Bartolo....The Seminole and Last Chance are expected to resume work in a short time.

PLUMAS COUNTY.

GOOD ORE.—Plumas *National*, September 13: The Eureka Mill, near Jamison, the largest and most costly mill in Northern California, is now working only 30 stamps upon a body of ore which yields an average of $30 per ton. The amount of rock being crushed is from 50 to 60 tons per day. When the mill starts up with its battery of 40 stamps upon $30 ore there will be lively times in southern Plumas.

DUTCH HILL MINE.—At Cherokee, in Butte County, the Spring Valley Company demonstrated the important fact that water can be conveyed over lofty hights and deep depressions in ordinary pipes made of thin iron. At Dutch Hill, in Plumas County, the North Fork Company have further shown the practicability of working rich placers profitably by elevating water by pumps driven by steam. At a point on Ohio Creek about ten miles from Prattville, this company, under the management of C. W. Reed, has constructed a dam from which, through a number 10 iron pipe, six inches in diameter, water is pumped to the distance of 700 feet and to an elevation of 328 feet. At that point the water is received in a large reservoir and is thence conveyed four miles through a flume to the diggings. The gold is coarse in character; the gravel wash extensive, and the deposit rests upon a slate bed. Just now work has been temporarily suspended for repairs upon the pipes and other machinery. In proof of the surprising richness of the mine, the company had a clean-up lately from an eight days' run, which yielded the snug sum of about 200 ounces of gold.

SAN BERNARDINO COUNTY.

Guardian, September 6: We had shown us a few days ago, a working test, made by Mr. Joseph Craig, of some ore from the "Blue Jay" mine of Frink & Co. There were two assays made of ore from different parts of the same ledge. One of the assays shows $602.90 per ton and the other $211.

B. C. Boren started on Thursday morning for San Francisco. We hope he will be successful in making necessary arrangements for the construction of smelting works here; he goes partly on that business.

SAN JOAQUIN COUNTY.

A PROMISING MINE.—Stockton *Independent*, Sept. 8: Parties in this city are interested in what is known as the Gem Ledge, situated two miles and a half northwest from Columbia, Tuolumne county. It is on what is called the Pandola road, leading from Gold Spring to Vallecito. It is a gold and silver bearing ledges, averages a little over 5 ft. wide, and upon which has been sunk a shaft about 85 ft. deep. A portion of the rock milled in San Francisco, $15.07 per ton; but one assay, we learn, was at the rate of $132.40, and another $146.54 per ton. Forty feet from the shaft there is running a stream of water sufficient to run a twenty-stamp mill. Work is going on in the shaft. A gentleman informs us that there have been 3 extentsons taken up on each end of the range. The first southern extension has run a tunnel 125 ft., striking the main ledge with good prospects. The main ledge is owned by F. M. Kennedy of Stockton, Capt. W. C. Ryan, Sam. Adams and Henry Monroe, of Columbia. Samuel Adams is the Superintendent. The rock from the main shaft can be seen at Hart & Thritt's, on Weber avenue.

YUBA COUNTY.

RICH MINES AT FORBESTOWN.—Marysville *Appeal*, Sept. 12: Messrs. Maddox, Plum & Johnson are raising some excitement in Quartz. Their claim is the northern extension of Messrs. Roberts, Fry & McCormic, who lately divided in a short time between $9,000 and $10,000 above all expenses, and are known as the Panorama Company. On the 1st and 2d instant one man got out enough rock (thirteen pounds) to yield $115.50; the 3d was election, the 4th felt tired and did not work; the 5th $147.25; the 9th $22; and to-day I look for him to bring in several pounds. This rock is cleaned by hand-mortar and they are saving the balance of the quartz which will pay well for milling. I do not write this to stimulate or excite, for the owners are not on the sell, although needy, and they are working as circumstances will admit. They have their plans and arrangements made for a big winter's work, and I honestly believe before the 1st day of May they will surprise themselves.

Nevada.

ELY DISTRICT.

WASHINGTON AND CREOLE.—Pioche *Record*, Sept. 7: The company now employs 35 men; and about seven tons of ore are taken out daily. Drifting still continues east, west and south — the east and west drift being on the ledge. Two winzes are being sunk, one to the east and the other to the west. Workmen are raising in stopes east and west of the main drift. In the stopes the ledge is about 1 ft. wide. Teams will commence hauling ore from the large pile now on the dump, Monday, Sept. 8, and the mill will begin crushing it on the 15th.

SPRING MOUNTAIN TUNNEL. — The sinking still goes on in the shaft on No. 3 ledge, in which a fair progress is being made. The ground continues hard down back of the foot wall. It is expected that ledge No. 2 will soon be cut at a depth of 150 ft. A cross-cut will be run thence to reach No. 3; and both veins exposed from that point. The prospects indicate that good bodies of ore will be found.

PIOCHE PHENIX.—After allowing this mine to be unworked for about two weeks, the owners have resumed operations. The only work now going on is sinking the shaft, which was commenced on Thursday last. The shaft is now down 550 feet.

RAYMOND & ELY.—The number of men employed has been reduced to less than 30 in all, above and below. There is now no work progressing, except that being done by contract, and the vicinity of the mine appears very dull indeed. Contractors doing only "dead" work.

AMERICAN FLAG. — The workmen are now running drifts east and west, and sinking the shaft. The men are divided into three shifts, in order to push ahead with all possible speed. The mill is now undergoing repairs.

CHIEF OF THE HILL.—A progress of 15 ft. was made on the 210-ft. level. There has been no material change in the appearance of the stopes during the week: 105 tons of ore now lie on the dump, awaiting shipment.

PIOCHE.—One hundred and ten tons of ore were shipped during the week. Bullion has began to come in from the mill. One hundred and fifty pounds of crude bullion had been received at the office.

SILVER PEAK.—A pile of ore is again accumulating on the dump and another shipment will soon be made to the mill. The incline is now 258 ft. deep and still being sunk.

MAZEPPA.—Work was stopped and the employees of the mine discharged on Tuesday last. The stoppage, however, is only a temporary one, as it is expected that work will be resumed with the usual force in a short time.

PORTLAND.—Ore is being shipped to the mill from the mine at present. Work which was suspended a few days ago, will begin again on Monday, by contract.

CAROLINE.—The company is now sinking the main shaft at the rate of 4 ft. a day. They have now attained a depth of 285 ft.

CHIEF EAST EXTENSION.—Ore of a tolerably good quality is being taken out, and workmen are assorting it on the dump as it comes to the surface.

BOWERY.—A little prospecting is being done and the shaft is being sunk.

CHAPMAN.—The work continues to the satisfaction of the owners without any alteration.

LOUISE.—The ledge continues to improve as the drift is extended.

IVANHOE.—The shaft is still being sunk and very fair progress is made.

NO ITEMS.—With regard to the Page and Panaca, the Meadow Valley, the Amador and the Newark. We could obtain no information whatever.

WASHINGTON AND CREOLE.—Pioche *Record*, September 14: Drifting east and west continues without change in the ledge. In the west drift a ledge was struck running northwest and southeast. A winze has been sunk in it about sixteen feet and raised about the same distance. This ledge is found to average about fourteen inches in width, and to be of very rich ore. A winze is also being sunk on the east of the main drift. It is now down about thirty feet, with about one foot of ore in the bottom. Yesterday eighty-seven tons of ore were shipped, and it is approximated that there are now four hundred tons of ore on the dump.

RAYMOND AND ELY.—Everything is running smoothly once more. Two shifts, of fifty men each, are now at work below, and about fifty men are working at the surface, making in all about one hundred and fifty. It is not the intention to put on more men. Between 75 and 80 tons of ore are taken out and shipped by rail to the mills daily. More ore could easily be taken out. The drift from the ninth level is now in 125 feet, and it is calculated that the ledge is only 15 feet distant from the southern end of the drift.

SILVER PEAK.—The sinking of the incline is being pushed ahead as fast as possible. It is now 265 ft. deep. Some excellent ore is being taken out. There are now on the dump about 30 tons of first-class ore, besides a large quantity of somewhat inferior quality.

HAVANA.—Drifts are being run east and west. The ledge continues about 4 ft. in width and the ore assays from $200 to $300 per ton. The ground is now being graded, preparatory to putting up a whim. There are now on the dump about 60 tons of good high-grade ore.

SPRING MOUNTAIN TUNNEL.—Work still continues in the tunnel with encouraging prospects of soon reaching good ore. Progress has lately been impeded by the hardness of the ground after leaving the vein. It is now, however, so far improved that 1 ft. per shift is made. Two shifts are working.

CAROLINE.—Three shifts of men are at work sinking and timbering the main shaft at the rate of five ft. a day. They have now reached a depth of 305 ft.

PACIFIC TUNNEL.—The Pacific Tunnel Company, which has for some time allowed the tunnel to lie unworked, will in a few days resume operations again. The Superintendent informs us that not more than 15 or 20 men will be put to work.

CHIEF EAST EXTENSION.—The workmen are still taking out ore, which is of a higher grade than that heretofore extracted. The ledge is improving in width and more ore than usual is taken out.

PORTLAND.—Nothing is being done in this mine except the sinking of the shaft. This will continue until the shaft is 300 ft. in depth.

BOWERY.—Sinking will continue until a depth of 400 ft. is reached, before the drifting to the ledge is commenced.

PIOCHE WEST EXTENSION.—Drifting west from the main shaft, with the usual force of men.

MERIDIAN.—Work in this mine will be resumed this week.

STILL SINKING.—Sinking continues in the South Side, Pioche Phœnix, Spring Mount, Ivanhoe, Chapman and Louise.

VULTURE.—Drifting on the ledge, a progress of 12 feet has been made. The face of the drift is all in ore. The greater portion of it is still low grade, with occasional bunches of exceedingly good ore. On the hanging wall there is a narrow streak, assays from which occasionally reach a very high figure. A cross-cut in the drift shows the width of vein to be eight feet, with a good clay gouge on the foot wall. We look upon the future of this mine as extremely promising.

WASHOE.

CROWN POINT.—Gold Hill *News*, September 13th.—Daily yield, 350 tons. The Brunswick mill, with a full working capacity of 160 tons, is crushing only 30 tons per day. The Mexican is tied up and undergoing repairs. The Morgan mill (steam power) is crushing 95 tons per day. Ore is still being extracted from the 1,000, 1,200 and 1,300-ft. levels. The stopes and ore-breasts throughout the mine are looking remarkably well. The north and middle winzes are being driven steadily downward. The south drift from the 1,400-ft. level is being pushed forward vigorously, and is in good working ground. Good progress is also being made in drifting from the 1,500 ft. station in a southeasterly direction. After paying the dividend of $3 per share yesterday, $50,000 was carried over to the Surplus Fund, which amounts to nearly half a million dollars.

CONSOLIDATED VIRGINIA.—The 1,200 ft. level (Gould and Curry drift) is being rapidly extended toward the new shaft of the Company. We are reliably informed that this drift is being run in the ore vein, and the ore therefrom is being hoisted and deposited in the ore house. In quality it is equal to any rock produced for years on the Comstock. At the same level a drift is being run from the main shaft to make a connection, and the faces of the two drifts are now less than 100 ft. apart.

OPHIR.—The drift west of the 1,100 ft. level is still in barren quartz. When it reaches the west wall a drift south will be started to see what can be found in that direction. The ore found at the 1,300 ft. level is not of high grade, giving assay of $15 or $20 on the average. It is of good size, however, and may lead to something better. The face of the drift is in clay and quartz. At the 1,465 ft. level some good looking streaks are also encountered in drifting south.

DAYTON.—At the upper level from the new shaft, the main drift west is in 225 ft., and from its drifts both north and south are being run in the vein. The south drift is in 20 ft., and the north drift 30 ft. High grade sulphurets are encountered in both drifts, gold predominating. Two hundred and fifty tons of ore are already out on the new dump. At the 310 ft. level the main drift west is expected to strike the vein in two or three days.

KNICKERBOCKER.—The main west drift, as well as the south cross-cut from it, are both being actively driven ahead at a good rate of progress. The faces of both drifts are in good vein-matter. Good ore is likely to be encountered at any time.

SILVER HILL.—Daily yield, 60 tons, keeping the Bacon mill steadily running. The ore bodies at the first and second stations are looking and yielding finely, and show every indication that they connect. The winze being sunk near the Justice line is progressing well and continues to be in a fair quality of ore. This mine shows general improvement.

WOONVILLE.—Yielding sufficient ore to supply the Ramsdell (10-stamp) mill. The incline is being straightened and put in shape to reach new bodies of ore. A new shaft will be started next week. It will be situated about 400 ft. north and 300 ft. east of the old incline, and will have three compartments. New machinery has been ordered for this shaft, and is being manufactured in San Francisco.

YELLOW JACKET.—The workmen are engaged to-day in changing the cables in the shaft. Preparations are being made to place a new pump column in the shaft. Arrangements will be shortly made to hoist the water by means of small pumping-engines from the 1,500 to the 1,300-ft. level. From thence it will be conveyed through pipes to the Imperial.

EMPIRE.—No new developments in the cross-cutting and prospecting drifts at the 1,600 and 1,700-ft. levels.

TYLER.—Shaft 155 ft. deep. Ground works favorably, and about 2 ft. per day is being made in sinking.

SUTRO TUNNEL.—Total length 4,347 ft. The rock in the face is very hard but works well. The drifts, both east and west, at the bottom of shaft No. 1, on the line of the tunnel, are progressing well. Work is resumed at shaft No. 2, and at the other two shafts work is about being started up, a plentiful supply of wood being obtained.

OCCIDENTAL.—The lower tunnel is being extended northward day and night, immediately and adjoining the ore vein. The face of the drift is now 150 ft. north of the last cross-cut. Another cross-cut will be commenced within a couple of days to test the ore vein at this point.

SIERRA NEVADA.—The mill continues running steadily on ore from the mine. The last clean up gave $7,200 from 900 tons of ore. The mine never looked better, and bids fair to never give out. Some unusually rich bunches of ore have been met with in the last few days.

SUTRO.—Superintendent Sheridan is driving ahead the work of developing this promising mine with the utmost energy. He has been putting in a pump this week at the main shaft, and proposes developing some good paying ore before long.

IMPERIAL.—At the 1700 ft. level the south drift shows improvement in the way of ore indications. The ore is in spots and bunches, some of which give very good assays. No other change to note. The sinking of the main incline progresses well as usual.

DANEY.—The pumps and all the machinery at the new shaft and hoisting works of this company will be completed and ready to go into operation about the last of next week, when the water will be pumped out of the shaft and sinking resumed.

BELCHER.—Our sources of information relative to this mine this week are again demoralized, and we are unable to state anything further than that there is nothing new to make mention of, but that the report of last week will do for this.

CALEDONIA.—Sufficient ore is being extracted to keep the Sapphire mill running. The ore breasts of the 500-ft level show finely, with continued improvement. Everything in and about the mine is working well, and to the best advantage.

SAVAGE.—The prospecting work at the 1600 and 1700-ft levels progresses well, with no new or important developments as yet. The sinking of the main incline also continues at a good rate of progress.

AMERICAN FLAT.—The ore at the first station shows well. At the third station no new or interesting developments are met with, but from present indications good ore is liable to be met with at any time.

JULIA.—Good headway is being made in the east drift. Low grade ore met with during the past week. The water is being gradually lowered in the shaft, hoisting 100,000 gallons per day.

NEW YORK CONSOLIDATED.—Shaft 350 ft. deep. Rock at the bottom soft, with streaks of quartz. Water increases, but is easily managed with the pumps. The machinery and everything going all right.

BUCKEYE.—Daily yield about 18 tons, which is worked at the Hope mill, Silver City. The

[Continued on Page 192.]

The Coal Fields of Coos Bay.

Among the many coal beds of Coos Bay, not the leaet interesting or valuable are those owned hy the

Northern Pacific Coal Company,

Who have an office on New Montgomery street, San Francisco. The coal beds of thie company are located in the Blue mountains, on the divide between the waters of the Isthmus Slough, that rnns from Coos Bay, aud the Coquille River, on the margin of the only gap or pass on theee monntains, between these two important points, and known as the Isthmus Pass. This range of mountains is one of the highest in Cooe county and is some thousande of feet high. The coal heds are a continuation of the coal fielde ou the east side of Coos Bay and are equal in quantity and quality to any coal bede yet found on the Bay. The veine of coal of thie company already discovered, are three miles long and an average of three-quarters of a mile broad; they run in thicknese from three and a half feet to nine feet, and if all the veins found were put together they would measure more than thirty feet in thickness. The company have secured 1,600 acres of coal lands in connection with their mine. The veins run lengthways, east and west, and dip at an angle of nine degrees north and south. The coal is eepecially adapted for household purposes. The coal from eome of the veins have proved, hy actnal experiment on hoard the steamer *Pelican*, to be euperior to the Mount Diahlo coal for generating steam. The company intend

Building a Railroad

From the mine to the deep waters of the Isthmus Slough, three miles, aud exteud it south to the Coquille River, making the road eix miles in length. This railroad will conuect that important river with Cooe Bay and the Pacific Ocean, the value of which, in developing and stimulating the lumbering and agricultural resources of the Coquille Valley, the coal fields and the general trade of Coos Bay as well as the husiness of San Francisco, could not he easily estimated. By keeping the military road to Roseburg in good order, that town and southern Oregon generally would get some of the advantages, but San Francisco will get the lion's share.

The gap or pass in the mountains is favorable for an eaey grade; the immenee qnantity of the hest of timher on the ground, and that there is deep water for vessels to come with railroad iron and other material to the end of the line, are important considerations for securing the road being built at a moderate cost. The road will he huilt on the principal of the narrow-gange, and a single track. The estimate is that it will cost ahout $10,000 a mile, or $60,000 for the six miles. A complete survey of the liue and other preparatione will be made this summer and fall, with the view of commencing the construction of the road next epring. The company intend putting a steamer on the Coquille River, to run in connection with and act as a feeder to their railroad. This is no unimportant matter, when it is taken into consideration that the Coquille River, its forks and branches are as long as the Willamette River and its forks, its soil as rich and productive, ite timber as good as any on the Pacific Coast, and navagahle for sixty miles at all seasons of the year. The business that this railroad will foster, stimulate and create will be more profitable to the company than the coal mine iteelf, and he of incalcuable value in developing the vast resources of the Coquille River and Coos Bay.

It is reported here that Ben. Holladay, Jr., ie one of the incorporators of the Northern Pacific Coal Company. If this is eo, and that he takes an active part in its intereets, and runs the steamer *Pelican* and other steamers, that he can or does control to Coos City, in the interest of thie company, he will get in coal, lumber and produce all the freight his steamers can carry; and hy making Coos City the main terminous, he can control a large share of the passenger trade that will come over the military road hy way of Roseburg, which is already considerahle. This railroad will be able to load with ease, three veesels of 1,000 tons of coal each day, and as many with lumher; this numher can he douhled when the trade demands it. Wm. Utter is the agent of the compauy at the Isthmus Pase. He has a large experience as a practical miner in Virginia, Pennsylvania and Mount Diahlo, and ie every way competent and reliahle for his responsihle and confidential position.

Thero are two rival companies orgauized to compete for cutting

A Canal from the Coquille River to Coos Bay.

It is intended to cut this canal from the Coquille River, hy way of the Beaver Slongh and the Isthmus Paes, to the deep watere of the Isthmus Slough that runs into Coos Bay. This contemplated canal would be six milee long and would probahly cost $500,000. One of the companies is called the

Isthmus and Coquille Canal Co npany.

The incorporators are F. G. Lockhart, J. C. Haynes and George Pratt, of Empire City. It is proposed to cut the canal 150 feet wide at the bottom, snd to have nine feet of water in it at low tide. Many of the advantages in favor of the proposed railroad are claimed for thie canal. That it would be of incalcuahle service for conveying splendid timher of the Coquille to the large lumher mille and shipyards of Coos Bay, there is no doubt, ae well ae serving many other important purposes. The incorporators propose to raise the capital stock of half a million dollars by sharee of $100 each.

The other canal company ie called

The Coos Bay and Coquille Coal Company.

The capital of this company ie placed at $1,250,000. It is incorporated for building a canal for the eame distance and in the same line as the other canal company. The incorporatore are W. H. Scott, A. P. Denison, G. H. Fitch, E. F. Russel and J. N. Dolph, all residente of Portland. This company have got the Government to consent to make a thorough survey of the intended line of the canal with the view, no douht, of asking Congress for a laud or money suhsidy. The incorporators can bring strong influence to accomplish this ohject. This company evidently mean business, and so far, seem to have got the inside track. There is ample room for the profitahle employment of both a railroad and canal. It would he difficult to put a limit on the resources and progress of the magnificent forest timber and agricultural lands of the Coquille River Valley, and the extent to which the coal and lumber business of Coos Bay and its tributaries will grow to.

To the mind of the thoughtful observer and deep thinker, the future of Coos Bay, the Coquille River, its valley and forests, present a vision of development, progress and prosperity that is gratifying to contemplate—that will amply reward the honest lahorer, the industrious settler, the persevering logger, the extensive manufacturer of lumber, the enterpricing shiphuilder, the honorahle merchant, and the fortunnate proprietors of the vast coal-fields, all of which combined will build up, in due time, industries and wealth that will do honor to the hands and heads of the people of Coos county. *Cor. Bulletin.*

New Mode of Lead Assay.—Mascazzini heats the ore to be valued with twice its weight of ammonia sulphate: the metale present are thereby converted into sulphates. By boiling with a mixture of diluted hydrochloric and sulphuric acids, all iron, copper etc., are dissolved, whilst lead sulphate and silver chloride are left. These are washed, dried, and reduced with zinc and hydrochloric acid; the resulting metallic mass is fused in a carhonate, five of horax, and five of etarch. Cruse, mininm, ores rich in silver, gold, antimony, tin, copper, etc., and analogous substances, may be thus assayed. If there is not enough lead present for cupellation in the caee of silver ores, more may he added.—*Dingler's Polytechnic Journal.*

Indian Lettuce, or Wild Lettuce.

(Claytonia Perfoliata.)

All readers of the Press, who are acquainted with the growth in the river bottoms of California, will recognize in the engraving the likeuess of a familiar friend among our native plants.

To all lovers of natnre whose good fortnne it has been to penetrate far among the ridgee, and spurs, and densely ehaded streams of our mountains, and especially to tourists who have realized life's dream of the suhlime and beautiful in mountain scenery hy drinking in, with their whole bsiug, the incomparable grandeur and beauty of Yosemite, the engraving of this modest, pretty plant will vividly recall its home among the rich green glades and icy streams of the Sierras.

Indian Lettuce is very generally distributed along the Pacific Coast. It is found throughout Washington Territory between the Cascade mountains and the sea, and extends at least as far south as San Francisco and its vicinity. Along our water conrses in the mountains, and where they wind their tortnous ways through Sacramento, San Joaquin and Tulare Valleys, and perhape etill further sonthward along the coast, it grows lnxuriantly. It nsnally selects a moist, sandy loam, rich and well shaded, ae its favorite haunt; but it will grow nnprotected by ehade on tbe poorest soils, and when once well-rooted, it ie not easily destroyed.

INDIAN LETTUCE, OR WILD LETTUCE.

It is one of the fineet sncculent herbs in all our flora, and stock is very fond of it. As an article of food eaten raw, it is one of the chief delicaciee among Indians, and hence ite most common name, Indian Lettuce. Connoisseurs who have tried ite leaves and stems, dressed in our more civilized styles, prononnce it a delicious salad. The whole plant, except the root, boiled and well seasoned, makes an excellent dish.

Before closing, we shall endeavor to describe this remarkable plant fnlly enongh to enahle our readers, with the aid of the engraving, to recognize it withont the poseibility of a mistake, should they wish to try it as a new salad, or spinage.

Botanically our Wild Lettuce belongs to the Purslane family. Its generic name, *Claytonia*, was given in honor of Dr. John Clayton, one of our earliest American Botanists, who, about the middle of last century, together with Gronovius, a dietinguished Dutch natnralist, puhlished a Botany of Virginia, called Flora Virginica. More than a dozen species of the genns *Claytonia* are described by botaniets, all of which helong to North America, except one that is a native of Siheria. Spring Beanty is the common name for all of these. Of the American epecies, all belong to the Pacific Coast, but two, known for the sake of distinction as the Virginia and the Carolina Spring Beauty, one or the other of which is fonnd along the Atlantic Slope from New Hampshire and Wisconsin to the Gulf of Mexico. The Virginia Spring Beauty, with its grass-like leaves, and its delicate pink, star-shaped flowers, veined with deeper red, is, of all the epring flowers of the Gulf States, a special favorite among children.

But our species of Spring Beauty under discussion, the Wild Lettuce, can be readily dietinguished from all its kindred, and from the great maes of other plants, by a marked peculiarity, which is very apparent from the engraving. Each stalk that bears flowere has upon it but a single fleshy leaf, shaped like a shield, and passes directly through its center. This is the reaeon for its specific name, *perfoliata*, from the Latin *per*, through, and *folium*, a leaf. Such a leaf is called technically a perfoliate leaf, and a familiar example of it is seen in yellow and scarlet honeysuckles. A dense hunch of these stalks, rarely more than six inches high, eaoh growing direotly from the roots, and each with its single leaf near the top, eurrounded by a cluster of small white flowers tinged with pink, make up the entire plant with the exception of a few radical leaves. The latter are so called becauee they grow directly from the roots instead of from the stalk. The radical leavee of the Wild Lettuce are abont the size and shape of a willow leaf, thongh rather shorter, and each attached to the root hy a long elendsr stem. The lower part of these stems and the flower stalke are tinged with red, while the color of the leaves ie a light green, sometimes purplish ou the under surface. It is in flower from April to August, according to its locality on our plaine and mountains.

As a further deecription to practice our young friends in their leseon in botany, given while deecrihing the American Cowslip, we shall call attention to the facts, that the calyx of the Indian Lettuce ie divided into two scale-like sepals; its corolla into five petals; it has five stamens and one pistil, the latter three-cleft near the summit.

But so emall are its flowers, that, to be qnite certain of eome of these points, you will find a pocket microscope useful, as ie the caee in the study of various other flowers, and of many interesting facts in botany.

San Joaquin Valley, August, 1873.—*By Ralph Rambler, in Illustrated Press for August.*

The Wood Flumes of Nevada.

Much is eaid about the wood flumee of this State, hut it is probahle that few persons who have not visited the lumhering regions of the Sierra Nevada Mountains have a proper appreciation of their utility, extent or cost. The general idea of them outside of the State would appear to be that they are nothing more than so many rickety troughs, eet npon poles, which serve ae a sort of make-shift by meane of which to eend wood and lumber from the top of a single hill to the level ground at ite hase. The fact is that the majority of these flumes are very suhstantial structures, in most inetances eeveral milee in length, the construction of which hae cost from $30,000 to $50,000. They are huilt upon a certain grade and pass over and wind around many hille in their course to the valleys, or other places where the wood and lumber carried down may be reached hy teams or by side tracks from the railroad. These flumes are huilt so large that timbers 16 inches sqnare and as many feet in length may be floated down them. Down a properly constructed flume these large timbers are floated hy quite a emall head of water; and not eingle sticks but long processions of sticke. Wood and lumber, are carried off by the same meane as fast as thrown into the flumes and dumped milee awae in an almost incredibly short time. By the use of the flume, wood, lumher and timber can by easily brought down from points in the mountains which would be qnite inacceesihle to teams. In eome places, where the ground ie very eteep, there are to be seen dry finmee, if we may so call them, or tronghs, down which wood is sent without the aid of water. These, however, are but straight chutes, running from the top to the bottom of a single hill or range of hills. In some places, also, there are chutes formed by laying a timher track, down which huge logs are sent. Along these tracks, where very steep, the lo s rnsh at railroad spsed, leaving behind them a trail of fire aud smoke. Such log-ways are generally to be eeen ahont the lakes, and are so contrived that the logs leap from them into water of considerahle depth, otherwise they wonld be shivered to pieces and spoiled for use in the mannfacture of lumher. The piles of wood to be seen at the bottom of some of the wood flumes are immense, amounting to thousands upon thousands of cords. —*Virginia Enterprise.*

Useful Information.

What to Do in Case of Accident.

Prof. Wilder, of Cornell University, gives the following short rules for action in cases of accident, which it will be found useful to preserve or remember:

For dust in the eyes, avoid rubbing; dash water into them; remove cinders, etc., with the round point of a lead pencil.

Remove water from the ear by tepid water; never put a hard instrument into the ear.

If any artery is cut, compress above the wound; if a vein is cut, compress below.

If choked, get upon all fours and cough.

For slight burns, dip the part in cold water; if the skin is destroyed, cover with varnish.

Smother a fire with carpets, etc.; water will often spread burning oil, and increase danger. Before passing through smoke, take a full breath and then stoop low; but if carbonic acid gas is suspected, walk erect.

Suck poisoned wounds, unless your mouth is sore; enlarge the wound, or, better cut out the part without delay; hold the wounded part as long as can be borne to a coal or end of a cigar.

In case of poisoning, excite vomiting by tickling the throat or by warm water and mustard.

If in water, float on the back, with the nose and mouth projecting.

For apoplexy, raise the head and body; for fainting, lay the person flat.

Washing Compound.—The use of soda for washing linen is very injurious to the tissue and imparts to it a yellow color. In Germany and Belgium the following mixture is now extensively and beneficially used:—Two pounds of soap are dissolved in about five gallons of water as hot as the hand can bear it; then next is added to this fluid three large-sized table-spoonfuls of liquid ammonia and one spoonful of best oil of turpentine. These fluids are incorporated rapidly by means of heating them together with a small birch broom. The linen is then soaked in this liquid for three hours, care being taken to cover the washing-tub by a closely fitting wooden cover. By this means the linen is thoroughly cleaned, saving much rubbing, time and fuel. Ammonia does not affect the linen or woolen goods, and is largely used as a liquor in the North of England.—*Rural New-Yorker.*

Utilizing Pine Leaves.—Pine leaves are largely utilized in Europe. They are converted into a kind of wool or wadding, which is used for upholstery instead of hair. A kind of flannel is also made from this fiber, which is said to be very superior for many hygienic uses, as for rheumatism and skin diseases. Vests, drawers, loose shirts, etc., are also made. In the process of manufacture an etherial oil is also obtained, very useful as a solvent, and as a curative agent. Gas is also made from the refuse and used for lighting the manufactories; or the entire refuse may be pressed into the form of bricks, when it becomes a most excellent substitute for coal.

An Indelible Red Ink.—Dr. Elsner states that an indelible red ink can be prepared as follows: Equal parts, by weight, of copperas and cinnabar, both in fine powder and sifted, are rubbed up with linseed oil with a muller, and finally squeezed through cloth. The thick paste can be employed for writing, or stamping woolen or cotton goods, and the color remains fast after the goods have been bleached. The reds usually employed are not fast colors, and do not resist the action of bleaching agents.

Shaping Soft Rubber with a File.—President Morton, of the Stevens Institute, states that he finds the ordinary thick sheet rubber, used in making up lantern tanks, and for many similar purposes, may be readily dressed into an exact shape with a file, if only it is supported by being clamped between plates of wood or metal in the vice. The file is used dry, and in all respects as in working on wood or metal.

To Crystalize Grasses, Flowers, Etc.—Dissolve six ounces of alumn in one quart of water, boil until dissolved; steep the grasses or flowers in the solution while hot. By the time the water is cold, the crystals are too large, add more water. Separate the little branches gently, taking off the superfluous lumps. Fern leaves oats, flax, and the long feathery grasses are the most beautiful for crystalizing.

A Good Cement.—A very adhesive cement, and one particularly useful for fastening the brass mountings on glass lamps, as it is unaffected by petroleum, may be prepared by boiling three parts of rosin with one part of caustic soda, and five parts of water, thus making a kind of soap, which is mixed with one-half its weight of plaster of Paris. Zinc white, white lead, or precipitated chalk may be used instead of the plaster, but when they are used the cement will be longer in hardening.—*Am. Artizan.*

Scent Powder.—A charming recipe for scent powder, to be used for wardrobes, boxes, etc., far finer than any mixture sold at the shops, is the following:—Coriander, orris root, rose leaves and aromatic calamus, each one ounce; lavender flowers, two ounces; rhodium wood, one-fourth of a drachm; musk, five grains. These are to be mixed and reduced to a coarse powder. This scent on clothes is as if all fragrant flowers had been pressed in their folds.

A Good Disinfectant.—Dissolve a bushel of salt in a barrel of water, and with the salt water slack a barrel of lime, which should be wet enough to form a kind of paste. For the purpose of a disinfectant, this home-made chloride of lime is nearly as good as that purchased at the shops and drug stores. Use it freely about sinks, cellars, gutters and outhouses, and in this way prevent sickness, suffering and expense.

Good Health.

Eating When Exhausted.

When the strength or nerve power is already worn out or used up, the digestion of food only makes a fresh demand upon it, and if it be unable to meet the demand, the food is only a burden upon it, producing mischief. Our bodies have been compared to steam engines, the food being the fuel and the steam produced the nerve power. The analogy holds good to a certain extent. If, when the steam is low, because the fire is low, you pile in to fast, a quantity of coal, you put out your fire, and if you have depended upon steam power to fan your fires, that is also extinguished. Beyond this the comparison fails. You may clean out your furnaces and begin again; but in the body the consequences of this overloading are dangerous and sometimes fatal. No cause of cholera is more common than eating freely when exhausted. The rule should be to rest for a time, and take some simple refreshment, a cup or a part of a cup of tea, a little broth, or even a piece of bread, or anything simple and in small amount, just to stimulate the stomach slightly and begin to restore its power. After rest, a moderate quantity will be refreshing. Never eat a full meal when you are exhausted. Take first a quantity of anything single which may be handy, and rest. Then after a time, proper food will be a blessing, not a burden. The fires will burn, the steam will be up, and you can go on your way safely. It is no amiss, in this connection, to say that children would avoid many a feverish night and many an attack of disease, if mothers would follow this rule.—*Ex.*

How Long Shall We Sleep?—The fact is, that as life becomes concentrated, and its pursuits more eager, short sleep and early rising becomes impossible. We take more sleep than our ancestors, and we take more because we want more. Six hours' sleep will do very well for a plowman or bricklayer, or any other man who has no exhaustion but that produced by manual labor, and the sooner he takes it after his labor is over the better. But for a man whose labor is mental, the stress of the work is on the brain and nervous system, and for him who is tired in the evening with a day of mental application, neither early to bed or early to rise is wholesome. He needs letting down to the level of repose. The longer the interval between the active use of the brain and his retirement to bed, the better his chance of sleep and refreshment. To him an hour after midnight is probably as good as two hours before it, and even then his sleep will not so completely and quickly restore him as it will his neighbor who is physically tired. He must not only go to bed later, but lie longer. His best sleep probably lies in the earlier morning hours, when all the nervous excitement has passed away, and he is in absolute rest.—*Christian Advocate.*

Aids to Digestion.—Dr. Marcet writes, reports the *Lancet*, in a pamphlet just issued from the press ("On a New Process for Preparing Meat for Weak Stomachs," London: Churchill, 1867). "I have often thought that, if there were a means of preparing meat, so as to enable its easy digestion by weak stomachs, a great boon might be conferred on a very large class of sufferers; and it has occured to me that by submitting cooked meat to some process similar to that which it undergoes in the stomach, food thus prepared would require but very little effort of the stomach to complete its digestion, and thus the body could be efficiently nourished, notwithstanding a debilitated condition of the digestive organs." Hydrochloric acid and pepsine being the principal natural agents for the digestion of meat in the stomach, he has thought that these substances might be applied to digest cooked meat in some degree previously to its being eaten, and that by giving the stomach animal food thus softened and dissolved, sufferers from disease of nutrition, causing wasting and emaciation, and who can take but little food, which they have much trouble in digesting, and others miserably tormented with dyspepsia, whose irritable stomachs cannot digest animal food, let it be ever so carefully cooked, might be enabled to take a little meat, and digest it well, the stomach being saved a certain amount of work. The food obtained by the process is a fluid "holding in suspension a light pulpy substance, most of which, when the liquid is allowed to remain undisturbed in a glass, is seen to fall to the bottom; it is, in a great measure, to this substance that its nutritious properties are due; but the pulpy mass is so minutely divided and so soft, as to be swallowed unperceived." It is a very palatable food, and is said to be acceptable to invalids.

What We Need.—Dr. Hamilton, of Buffalo, very plainly and tersely remarks: We need for our dwellings more ventilation and less heat; we need more outdoor exercise, more sunlight, more manly, athletic and rude sports; we need more amusements, more holidays, more frolic and noisy boisterous mirth. Our infants need better nourishment than colorless mothers can ever furnish, purer milk than our distilleries can manufacture; our children need more romping and less study. Our old men need more quiet and earlier relaxation from the labor of life. Men, both young and old, need less medicine and more good counsel. Our cities need cleansing, paving and draining. The Asiatic cholera, the yellow fever, the plague, and many other fearful epidemics, are called the approbia of our age, and our fellow citizens upbraid us with feebleness and inefficiency of our resources. When will they learn that, although we do not fail to cure these maladies, the more precious secret of prevention is in our possession and has been for these many years.

The Philosophy of Ill Health.—Sickness is very largely the want of will. Everything is brain. There is thought and feeling, not only, but will: and will includes in it far more than mental philosophers think. It acts universally, now as upon mind, and then just as much upon the body. It is another name for life, force. Men in whom this life or will power is great; resist disease, and combat it when attacked. To array a man's mind and will against his sickness is the supreme art of medicine. Inspire in men courage and purpose, and the mind-power will cast out disease. "Nothing ails her. It is only imagination," said the nurse to him one day.—"Only" the imagination? That is enough. Better suffer in bone and muscle than in the imagination. If the body is sick, the mind can cure it; but if the mind itself is sick, what can cure it?—*Norwood.*

Skin Diseases—Little black specks are occasionally observed on the nose and forehead of some individuals. These specks, when they exist in any number, are a cause of much unsightliness. They are minute corks, if we may use the term, of coagulated lymph, which close the orifices of some of the pores or exhalent vessels of the skin. On the skin immediately adjacent to them being pressed with the finger nails, these bits of coagulated lymph will come from it in a vermicular form. They are vulgarly called "flesh-worms," many persons fancying them to be living creatures. These may be got rid of, and prevented from returning by washing with tepid water, or proper friction with a towel, and by the application of a little cold cream. The longer these little piles are permitted to remain in the skin, the more firmly they become fixed.

Domestic Economy.

Squirrel Stews.—Half a dozen of these marauders make a nice dish to set before as many grown-up people who relish fresh meat for dinner. He lives upon the best of food, and lives a free, active life, but its very activity gives its muscle a tendency to toughness. This can be overcome by sufficient boiling. Thus, in the first place, it must be carefully skinned and dressed while yet warm. If the entrails are left in the animal until the body is cold they will injure the flavor of the meat more or less. Put them in cold water enough to cover them, and skim the pot carefully when it comes to boiling (this always in boiling or stewing meat or making a soup). Two hours gentle boiling is not too much for young squirrels, and three hours for old ones. Never season them until they are done tender, and then you will add salt and cream, or a bit of yellow butter, according to your judgment. A little thickening (a tablespoonful of flour stirred smooth in half a cup of milk or water) stirred in while the pot is boiling will make a nice gravy. Pour the whole over slices of bread or split gems. The strong flavor of squirrels comes from fat. Cut this all away carefully before cooking.

Salmon Cutlets with Caper Sauce.—Take a slice of salmon two inches thick, carefully remove the bones and skin, cut it into slices half an inch thick, and flatten each on the chopping-board with a cutlet bat dipped in water. From these slices cut as many cutlets of a uniform shape as you can. Place them quite flat on a well-buttered baking tin, sprinkle pepper and salt over them, and, ten minutes before they are wanted, put them into the oven with a sheet of buttered white paper over them. Put all the trimmings of the salmon into a saucepan with carrots, onions, thyme, parsley, a bay leaf, a few cloves, some whole pepper, salt to taste, and a little more than a pint of good stock. Leave this to boil gently till reduced one-half, then strain the liquor into a basin, and remove any fat there may be. Melt a piece of butter the size of a walnut, add to it a teaspoonful of flour, and stir it on the fire till it is well colored. Add the liquor to this, and continue stirring until the sauce boils, then add a heaped teaspoonful of capers; pour the same over the cutlets, and serve.

How to Bleach Cotton Cloth.—It may sometimes become necessary or convenient to bleach a piece of cotton cloth, although as a general thing it is better to obtain white clothes already bleached. Home-bleaching, moreover, is apt to injure the fabric more than the process in use at the factories, especially when manipulated, as it always is there, by skilled hands. However, cloth may be bleached as follows:

To five pounds of cloth take twelve ounces of chloride of lime. Dissolve the lime in a small quantity of boiling water; when cold, strain it into a sufficient quantity of water to cover the cloth. This must be boiled fifteen minutes in strong soapsuds, and rinsed well in clear water. Then put it in the lime-water from ten to twenty minutes, airing it well by lifting up and down. Rinse thoroughly in warm or cold water.

Orange Pudding.—Take four fair-sized oranges, peel, seed, and cut in small pieces. Add one cup of sugar and let it stand. Into one cup of nearly boiling milk, stir two tablespoonfuls of corn starch, mix with a little water and the yolks of three eggs. When done, let it cool and mix with the orange. Make a frosting of the whites of the eggs and half a cup of sugar. Spread over the top of the pudding, and put it into the oven for a few moments to brown.

Parsnip Stew.—Pare and slice together, in the proportion of one large parsnip to three or four medium sized potatoes. Cook thirty or forty minutes in a small quantity of water, so that when you have put in a little flour thickening it will be nearly as dry as hash; though some might prefer it more moist. A little cream improves it. With no other addition than a little salt, this forms a delicious food.

A Good Recipe for Yeast.—Take three large potatoes, grate them, pour on them one quart of boiling water, add to them one quart of water in which a small handful of hops has been boiled; half a cup of sugar; the same of salt, and two-thirds of a cup of yeast. Bread made from this yeast will never sour. The hop tea must cool before being mixed with the other ingredients.

GENERAL EDITORIALS. — Huerne's Self-Cleaning Filter; The Utah Mining Swindlers, 177. Indian Lettuce, or Wild Lettuce, 182. The Labor School Question; The Science of Soil; Academy of Sciences, 184. The Occult Sciences and Mibing; Westcott's Universal Chuck; Mining District in Ventura County; The State Fair, 185.

ILLUSTRATIONS.—Huerne's Self-Cleaning Filter, 177. Indian Lettuce, or Wild Lettuce, 182. Westcott'a Universal Chuck, 185.

CORRESPONDENCE.—Notes of Travel in Utah Territory, 178.

SCIENTIFIC PROGRESS.—The Heat of the Moon; Annealing; Lunar Light Upon Vegetation; The Origin of Meteore and Comets; Making Mistakes; Test for Sewage in Water; A New Red Coloring Material from Anilin, 179.

MECHANICAL PROGRESS.—Utilization of Furnace Slag; A New Ice-Machine; A Fire-proof Stove; Mr. Bessemer's Channel Steamship; Improved Steam Rock-Drill; Hail Columbia; Gas Fokers, 179.

MINING STOCK MARKET.—Table of Daily Salea and Pricee and Comparative Prices for the Week; Notices of Assessments; Meetinga and Dividends; Review of Stock Market for the Week, 180.

MINING SUMMARY from various counties in California and Nevada, 181.

USEFUL INFORMATION. — What to Do in Case of Accident; An Indelible Red Ink; Shaping Soft Rubber with a File; A Good Cement; Scent Powder; A Good Dieinfectant, 183.

GOOD HEALTH.—Eating When Exhausted; How Long Shall We Sleep; Aids to Digestion; What We Need; The Philosophy of Ill Health; Skin Diseaséa, 183.

DOMESTIC ECONOMY.—Squirrel Stews; Salmon Cutlets with Caper Sauce; How to Bleach Cotton Cloth; Orange Pudding; Parsnip Stew; A Good Recipe for Yeast, 183.

MISCELLANEOUS. — Twenty-Ounce Diggings; The Alaska Mines; Prevention of Waste in Manufacture; Colossal Dam, 178. The Coal Fields of Coos Bay; New Mode of Lead Assay; The Wood Flnmea of Nevada, 182. A Training Ship and Labor Schools; Skillful Navigation in a Fog; Astronomical Notes; Water in the Minea, 186.

The Calistoga Gold Mine.

We have seversl times alluded to the St. Helena Gold mine in Napa County, and published extrscts from other journals in relation to the mine. Its msin peculiarity lies in the fact that it is situated in the Coast Range where we do not expect to find gold in paying qnantities. Our friend, W. A. Skidmore, recently paid a visit to this miue and as he has had con iderable experience iu such matters, heiug a deputy of the United Ststes Mining Commissioners, we asked his opinion of the mine, which is more to be relied on than the statements of interested parties. He eays:

In the course of my rambles I came upon a veritable quartz ledge—a novelty in the Coast range. It is known as the St. Heleua and is situated on the S. E. slope of the mountain of the same name in a formation of porphyry and trachyte. The rock is peculiar in ite crystalization and granulation and rather puzzling to one accustomed to the quartz of the gold belt of California and the silver regions of Nevada. But there it is, four to six feet in width, good walls, bold croppings, and all the concomitants of a first class mine, such as wonld, if situated in Pioche or Washoe, break many a heart and pocket, or make the owner's fortune ou the stock board. The quartz carries gold and silver, associated with cupriferous pyrites. Average assays show $20 to $25 silver, and $10 to $15 gold. It was discovered several years since hy Richard Swift, a prospector, who, however, did not think enough of it to take it up until last spring. They now have ont 150 tons of fine looking quartz. It is being worked by our irrepressible Alex. Badlam, in connection with a few citizens of San Francisco, among whom are a well kuown speculative business man and a member of the board noted for his boldness and sagacity iu stock operations. If the St. Helena was not so near home it would create a sensation iu mining matters.

THE Grove Tunnel Company's hoisting works, ore-house and other buildings, at Austin, together with a large amount of wood, were destroyed by fire on the 11th iust.

The Labor School Question.

Ou page 186 of the present issne we have printed in full the bill and its provisions, looking to the establishment of labor schools in connection with our common school system, which the Mechanics' Deliberate Assembly of this city has had drawn up, with a view to its publication and general criticism by the press of the State, previous to its final revision by that body, and submission to the action of the next Legislstnre.

The people are becoming more aud more convinced of the importance of some practical move in this direction. It is nearly as essential, at least with the grest msss of our hoys and girls, that each individusl should be properly fitted for earniug a livelihood, as it is that they should be instructed in the ordinary brsnches of a commou school education. Nine-tenths of our people work for a living; how important then, that iu their youth they should be properly taught some trade or other means by the exercise of which they may earn that living.

Time was wheu there was little difficulty in finding opportunities for boys to euter the varions shops of mechsnical iudnstry, where they might learu such trades as they or their guardians might elect; but for various reasons, which we hsve here no time to consider, such opportunities are now rare, and our boys are necessarily compelled to grow up in idleness, or seek casual employment, which fails to fit, or rather which sbsolutely unfits them for any permanent or regular business. The evil of such a state of things has long been a subject of anxious and earnest comment; and perhsps in no portion of the Union is it more general, or attended with worse consequences than here in Ssn Francisco. So great has this evil become, that a large number of our most snbstantial citizens have sssociated themselvea together, and held numerons meetings, at great sacrifice of time aud personal comfort, to devise some remedy therefor. The result of their deliherations has culminated in the Bill for a law to which we have already alluded, aud a careful consideration of which we would commend to all onr resders.

Some plau mnst be devised to meet the grave emergency which is upon us, but we think no one who has had a hand iu maturing the one proposed, will presume to say that it is perfect, or will feel aggrieved at any houest criticism upon its merits. It has now been before the public for some cousiderable time, (since the 10th iustaut), and thus far has elicited very little adverse criticism—the best evidence thst it is at least a fair opproximation to the desired end.

The plan proposed is not altogether new, nor needit cost any very large sum to give its general principles a fair trial. As drawu up it may be somewhat too general in character. As it is quite experimental, it wonld probably be better to move slow in getting it into execution—that is let it be first connected with some one or two ouly, of our grammar schools—that number would we quite sufficient to enable us to watch the progress and judge of the merite of the proposed system. Neither would be necessary to experiment outside of Ssn Francisco, until experience had shown its value and practicability. We see no reasou why labor should be compulsury, either npou all schools, or all the individuals of any particular school. Let the lahor portion he a voluntary act on the part of the child or guardian, and accompanied, perhaps with a less number of studies thau may be taken up by the pupil who choses to devote all his time to study.

It is well knowu that a system of labor iu conuection with study has long been connected with many of onr academies and colleges; the writer wae a participant in sueh labor during his academical studies, some forty years ago. The plan is known to work well, and is more than self-sustaining, as students are able to make it a partial means of support; but, as now practiced, it is not accompanied with mechanical instruction. Still we see no reason why it might not be made nearly or qnite self-sustaining, even with all needed instruction, especially after the first outlay or plant has been provided. If we are not mistaken, the plan, precisely as contemplated iu this hill, has already been introduced into the G rard Orphau School, at Philadelphia.

By all means let us have a beginning at once; connect shops with at least two of our grammar schools; establish a polytechnic school and a school ship.

PROSPECTORS have been at work in a lively manner in Montana, this season, aud have had good success.

Academy of Sciences.

The regular semi-monthly meeting of the Cslifornia Academy of Sciences wss held on Monday evening last, R. E. C. Stearns in the chair. Messrs. Louis Gerstle and Simon Greenwald, both of the Alaska Commercial Co., were elected life members. Quite a number of

Donations to the Cabinet

Were made. Dr. F. Steindachner presented a male specimen of the "Cock of the Rock" (*Rupicola Peruviana*). H. G. Bloomer presented a female belted Kingfisher preserved by an improved process of embalming. C. D. Gibbes presented a collection of pebbles and shells from Pigeon Point and the Pescadero Pebble Beach; also a number of sea weeds; specimens of minerals from Californuia and Arizona by Mr. Durand. A collection of 58 fossil shells was sent from Sau Diego by Henry Hemphill. They were obtsined while digging a well at a depth of from 120 to 125 feet, and belong to the post-pliocene division of the tertiary epoch. Most of the species are still found in the bay. A hranch of California Nutmeg from Redwood Forest, on the stage road between Redwood aud Pescsdero, was received. Rev. S. W. Blakislee sent some fresh water *Algae* from Mammoth Springs, Lassen county, Cal. They were found growing 12 feet under the surface of clear spring water. They are egg-shsped, hollow, contaiuing a liquid and a soft nuclens. There were two new forms presented. The usual donations to the lihrary were received and also several new hooks.

Relics of the Aborigines.

Dr. A. W. Saxe called the attention of the members to a locality which hss never been examined to any extent, which is probably rich in archæological relics. It is situated just south of the mouth of Laguna Creek, six miles north of Santa Cruz. At this place there is a mound about 15 feet deep aud about 70 feet ahove sea level, which was apparently collected by the aborigines of the county. Parts of the mound can be readily examined. The face opening towards the gorge has broken off and deposits of different eras can be seen, in which are to be found all kiuds of implements, such as arrow heads, the crescent-shaped knife, loug spear heads, etc., in all styles of manufscture. The most interesting fact conuected with this discovery is the fact that tons npon tons of chalcedony rock like that below Monterey, are found there, some having the appearance of geodes, but mostly solid. These boulders have an average diameter of four inches, noue less thau two and few exceeding five. A ship-load could, perhaps, be procured there. They were evidently carried from a long distance to this locality. He could find more like them from the north of Pescadero Creek for some distance down the coast. The bluff upon which they sre fouud ie composed of sedimentary rock. The Doctor could form no conjecture as to the purpose for which these rocks were carried thither. He suggested that some of the members should go and examine the locality carefully, as he was eure it would be of interest.

The European Sparrows

Were the subject of a few remarks by Dr. Geo. Hewston. He could see no ressou for the Were the subject of a few remarks by Dr. introduction of a foreign bird, when a native bird, the Western white crowned sparrow, is just as good. There are a few in the gardens in the southern part of the city. This native hird can easily be domesticated and has none of the objectionable points which the English Sparrow has. It frequents the neighborhood of gardens aud has a very sweet song. This bird destroye caterpillars, grubs, etc., and is easily domesticated but is easily destroyed by cats. A pair of these birds came to this garden and reared a brood; while they were there he had no trouble from caterpillars or bugs. A cat killed one of them and next year they did not come, and the garden was overrnn by insects. He thought that these birds ought to he protected, instead of introducing others.

The Chairman read a note from Presideut Davidson, stating that the Trustees had several conferences with Mr. Lick in regard to the difficulties that accompany his conditional deeds. They had found him earnest and willing to make such amendments as would bring about a practical and complete solution of the problem, and the members could rest assured that the prospects of a favorable ending of the negotiatione at an early date are very cheering. Dr. Henry Gibbons, made a few remarks about the proposed balloon voyage across the Atlautic and agreed that there wae some reason to believe in the existence of a strong westerly air current. He thought the project much less chimerical than many projects before intro-duced; there is a permsnent upper current from west to esst. This is not only worked out theoretically but is demonstrated by the course of high cirrus clouds. Mr. Stearns said thst they would undonbtedly gain scientific data of importance if the voyage wss eveutnally csrried out. Dr. Gibbons did not commit himself to the balloon enterprise, but thought they ought to go first from the Pacific to the Atlautic Coast. This idea had been suggested by Prof. Henry to Prof. Wise, but the latter had preferred in case of accident to fall on water rather than on land. Robert E. C. Stearns, read a paper entitled "Remarks on the Upper Tuolumne Vslley," which we will give in fnll in our next issue, want of space forbidding our printing it in this number.

The Science of Soil.

The proper crop to be planted iu a giveu soil, that which will grow to the best advantage and produce the largest yield, is a question of vital importance to the settler upon newly located lsnd, and even to those who hsve long tilled the land under their care without reference to its natural qualities. Land may he occupied for yesrs, and still he cultivated on a system purely experimental. As a result the full capability of the soil is not utilized—not that it should be exhausted. There is nesrly always a choice of crops, some one of which will succeed better than any other. Then there are uses to wbich land msy be put besides cropping. It may he employed as pasture for cattle, or retained as a sheep range; whatever be its destiuation, there is a preference. True, additional elements must be considered, as climate, market, home wants, etc. Our position is that, taking all these into sccouut, mnch more depends ou the character of the geological formation thsu is generally admitted.

How shall we know what is the hest use of a particnlar soil? By the experience of others, verified by our own observatiou. This experience is garnered in the mnch ahused agricultural books, where men collate the facts noted as results of their own prsctice, snd compare with the opinions of others, thns enabling the reader to form sn independent estimate.

Soil, it is known, comes from the wear and tesr of nature. It is the dust of the great workshop wherein we dwell. The ever active agencies of wind, water and frost, chemical and volcanic changes, together with the gentler influence of orgsnic life, have made soil whst it is. Consequently the vsrious minersl species may be expected to exist in irregular proportions in different localities. And such is the case. The exhaustless forces of nature have crumbled and overlapped and mixed the coponent materisls of the earth's crust, nntil every kind, eandy, calcareous, or clayey, is commingled on the surfsce. This gives rise to diversity, and hence accepted laws of selection, such ae these: Where a thin chalk overlies au upper green saud, a soil suitsble for wheat and hops is to be looked for; from au overlspping clay, often a good barley lsnd, while a plastic clay produces a heavy wheat land. Rich, loamy soil is, however, caused by the mixtnre of all three kinde of stratified rocks, the limeetone, the sandstone snd the clay. Among unstratified rocks there are granite, trap and lava, speaking broadly; the first gives a very poor, the secoud a good, aud the last a very fertile soil. Instances proving these seemingly arbitrary assertions are not wanting. Much, too, depends on the order of position in the strata, as regards drainage or retention of moisture. Thus we fiud that geology, one of the yonugest of the eisterhood of science, may be properly classed among the so called (an invidious distinction) practical ones. Here is a field where geology, mineralogy and chemistry mutually overlap one auother, just as do the constitnent strata of the crust, forming a firm basis on which to plant seeds of progress.

THE DIFFERENCE IN TEMPERATURE of Virginia City and Gold Hill, Nevada, is about five degreee, although the two towns are but one mile apart. Gold Hill has a temperature five degreee warmer than Virginia, a fact which the *Enterprise* accounts for hy statiug that the former town is situated in a cañou, with hills of considerable hight on both sides.

THE tailings mill, near Shermantown, White Pine, has been sold by J. B. Oshorne, to the Eberhardt and Aurora Company, at Eberhardt, and will continue to be worked under their administration.

The Occult Sciences and Mining.

We have heard of a good many instances where miners have started a tunnel in the side of a hill and kept at it with commendable pluck and faith, not only for months, but years, always incited to renewed energy, with the hope of striking gravel ahead. Sometimes the golden goal has been reached, and again, after all their resources were exhausted, they gave it up for awhile, only to begin their labors anew, or else have sold out to persons who hoped to reap the reward with little trouble. A case in point is that of the Pioneer Tunnel, at Sebastopol, which was started in 1856, and has been worked intermittently ever since. Many thousand dollars have been expended and a long tunnel run, but pay gravel was not reached. The tunnel has now been sold to a Mr. Billings, who, according to the *Mountain Messenger*, has taken spiritual advice, and feels confident that he knows pretty near where to work for gravel.

Here then is a gentleman who hath no faith in mining experts, no desire for accurate surveys, no necessity for doing hard work, but hopes to make his fortune by faith in spiritual advice. It seems to us that Mr. Billings, being on such good terms with the spirits, is in a measure throwing away his advantages by going into a small tunnel speculation. He has faith, evidently, for he has put money up, and it requires a large amount of faith to do that in mining operations. Now we opine that if this gentleman would come to this city and succeed in imbuing some of our capitalists with some of his faith, he might transfer some of their money to his own pockets. What a jewel he would be for a mining ring to operate, and his reports as an expert would have the effect of putting out our Jauins, Kings, Sewells, Phillips and a host of lesser lights. If some of our numerous mining trustees and Presidents could only see down into the Comstock lode as Mr. Billings sees through the heading of the Pioneer Tunnel, what a jolly thing it would be—for them. They would pay Mr. Billings a princely salary to lend them his eyes, or his faith, or his "spiritual" charms, whichever it is that sees through geological formations, as common mortals do through glass. Or the gentleman would doubtless stand a good chance of a fat job from Government, under the United States Mining Commissioner, for instance, as then the Commissioner would not be under the necessity of depending upon owners of mines for descriptions of them for his report; his deputy could see the whole thing at a glance. He might do well going round the country to tell some of our smart mining men when their mines were about to "peter out," so that they could sell them to our English cousins in time. But if Mr. Billings would see through the ways of some of our Mining Trustees and Rings, he would perform more service to the country than in any other manner.

We have heard of several instances where men went into this business under the same auspices as Mr. Billings, but as far as we know their profits have been "spiritual" as well as their informants. The days of divining rods, willow switches, portents, astrologers, etc., in connection with mundane affairs have gone by, and those who trust in them lean on a broken reed. For the consolation of a few of our readers, however, we will relate one instance in our experience where "spirits" were influential in picking out a good ledge.

A few years ago when we were "in the mines," a new district attracted our attention, which promised to be a camp of considerable importance. We remained there several months, and shortly after our arrival there came to the little town a diminutive Dutchman of bibulous propensities, who, though drunk more than half his time, seemed to have unusually good luck in making locations. On one occasion while he and a congenial companion were on a "spree," they made such a disturbance in the little place that threats of a ducking were freely made. Somewhat alarmed at their hostile demonstrations they each procured an extra bottle of aguadiente, and left town, wandering off several miles into the brush, where, after protracting their debauch as long as possible they fell into the sleep of the innocent—or the drunkard—which we all know is sound. On awaking in the morning, our little Dutchman found that he had for a pillow a boulder of quartz croppings almost as big as a bucket. While lying there meditating on the uncertainty of human affairs and the propriety of going back to town for more whiskey, he did what any honest miner would do—spit on the rock and rubbed it with his fingers. Thoughts of whiskey and duckings were quickly banished by the sight of gold in the rock; not only a scattering here and there, but a plentiful sprinkling of the yellow color. In miners' parlance the boulder was "lousy" with gold. That ledge has since sprung into prominence and is at this time being worked with good profits, although the discoverer sold his interest for only $5,000. This is the only case we ever knew where "spirits" had anything to do with the discovery of a mine that was worth anything.

The Westcott Patent Lathe Chuck.

The accompanying cuts are representations of the new combination (universal and independent) three or four-jawed lathe chuck, invented by John H. Westcott, of Oneida, Madison Co., N. Y. The chucks are made at the Oneida Steam Engine and Foundry Co., at that place, under the supervision of the inventor. The claims of the inventor for superiority of this tool over others of like character are: First—Its simplicity, strength and facility with which it can be changed from a universal to an independent action of the jaws. Second—The reversibility of the jaws, enabling the workman to chuck a much larger piece on the same sized tool than can be done on any other chuck in use. The shape of the jaws, which is such that by reversing them any chuck will hold securely the largest or smallest drill or reamer.

The improvement in this invention consists

Fig. 1

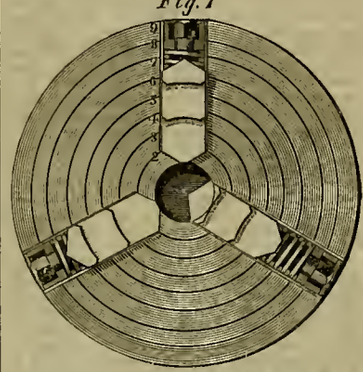

Fig. 2

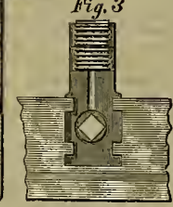
Fig. 3



WESTCOTT'S UNIVERSAL CHUCK.

in not only making the dogs reversable, but also in making them to act independently of each other, when required, as well as to act concentrically and simultaneously. The chuck is, therefore, enabled to seize and hold firmly irregular forms, or, to hold a piece of work in an eccentric position.

Fig. 1, is a front view of the face plate of the Chuck. Fig. 2 is a vertical section, and Fig. 3, is a plan view of one of the dogs, reversed.

B, figure 2, is one of the dogs, not reversed. *B*, is a screw which works the dogs, independently of the other dogs. The dog slides into a groove in another sliding piece, or block, a section of the grove in this block being shown in figure 3. The block *C* has at its back a spiral screw plate, which is engaged by an annular ring, *D*, which, also, has on its front face a corresponding spiral screw thread. The annular ring *D* is held to its place by a nut *E*, threaded upon the boss, *F*, of the face plate. The whole screws on to the lath spindle, in the usual manner. It is evident that all which is necessary to reverse the dogs, is to take out the screws and turn them the other side up. In this position they may be made to hold a very small piece of work. The Chuck is adapted to a greater variety of work, than almost any other we have seen.

What one Manufactory will Do.—One manufactory employing a hundred men will support an additional 500 people. Three hundred families will disburse annually, on the average, $250, or $75,000 in the aggregate. This money will be drawn into the town from the outside, where the manufactured goods are consumed, and the interest of this $75,000 at ten per cent. would be $7,500. Three hundred families, too, would require a hundred houses, thousands of pounds of agricultural produce, and thousands of yards of cotton and woolen goods, thus giving health and impetus to every branch of industry.—*American Manufacturer.*

A Mining District in Ventura County.

Mr. A. D. Brown called on us this week and gave us some items in relation to Lockwood District, a new mining locality in Ventura county. It was first discovered a year ago last July, but little work was done there at the time. Parties came in from the agricultural districts in the vicinity, and made a few locations on general principles, but no developments of any account were made. There are perhaps twelve or fourteen locations. The district is in the northern end of Ventura county, at the headwaters of Piru Creek. There is plenty of timber in the vicinity, and some of the claims are within a hundred yards of the creek, in which there is water all the year round. Mr. Brown says there are about 200 inches of water there now at this dry season. It is 45 miles from the mines to Bakersfield, and about 100 from Los Angeles. A few men are there now working these localities.

Mr. Brown has located a ledge and sunk upon it 15 or 20 feet. He has had a number of assays made of the ore, one of which showed a value of $199 in gold and $33 in silver; another $285 in gold and $19 in silver; and still another $505 in gold and $16 in silver. The claims are located on a belt of slate formation which is about five miles in length and three-quarters of a mile wide. The ledge Mr. Brown owns, he tells us, is some thirty feet wide and crops for 2,700 feet. A district has been laid out and a recorder appointed. The country near by is not settled up much, there being only a few sheep and cattle ranches near by.

The tops of the mountains in this vicinity are said to contain gravel deposits which spread over quite an area of country, but are universally on the summits or table lands of the mountains. For this reason they are not worked, water not being readily procured. Some large deposits of gravel have been found at a place called San Feliciana, about 18 miles below; these mines are what were worked many years ago. A Spanish ranch was "floated" over these mines so they are not now worked. They cannot get fall enough to work them conveniently, but the owners of the ranch, or their agents, recently made a survey to see if they could not tap the creek above and get water down to the ground. Last winter a few men worked on the south-west branch of the Piru Creek, about three miles from Lockwood, but there was no water in the summer. The north-west branch of the creek is fed by springs from Lockwood Valley, which run all the year round; but the south-west branch is dry in the summer. At this place the gravel was of the same class as that on the top of the hills, but in this particular locality it was low enough down to get water. Mr. Brown is trying to get some one interested to go down and see the mines at Lockwood in hopes that they will develop the large ledge so as to make it a paying property. A mill is needed of course, but according to his account water power is very handy. He ought to have no trouble in inducing parties to invest, if his statements are verified by practical miners. A ledge 30 feet wide which assays from $70 to $505 per ton will not go begging long wherever it may lie. The occurrence of gold in other localities near by ought to encourage others to visit these mines and examine them closely.

The Lost Ledge quicksilver mine, near the Geysers, Sonoma county, has made its first shipment of metal—five flasks—and shipments hereafter will be made regularly.

Patents & Inventions.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., September 16th, 1873.

For Week Ending September 2d, 1873.*

Heater and Blower.—William M. Jackson, Woodland, Cal.

Boot Crimping Blocks.—Henry Bordner and Dennis Sullivan, Virginia City, Nev.

Manufacture of Pipe.—Geo. L. Eagan, S. F., Cal.

Governor Cut-Off Gear.—Herman H. Meyer, Denver, Colorado Ter.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

The State Fair.

The twentieth annual Fair of the State Agricultural Society is now in progress and bids fair to equal if not excel any former exhibition. Monday, the opening day, as usual was mostly occupied in the reception of stock at the cattle grounds and the reception and arrangement of articles at the grand Pavilion; and though the day was one of busy preparation with all interested, the evening showed a remarkable and pleasing progress. The Pavilion is tastefully decorated which adds greatly to the display.

The usual races, that now make so prominent a feature at most of our agricultural fairs, were indulged in on Monday and better attended than on any other first day of former State fairs, and passed off quite to the satisfaction of all interested—except, we suppose, those who lost their money.

It is impossible for us to give in detail an account of the stock on exhibition; but among the first of the more interesting will be that of the Angora Goat and its grades; a large number will be exhibited and will as surely command special attention. There is also an excellent show of fine horses, that will do credit to the State; whilst the exhibit of fine blooded cattle will be superior to any former one.

Tuesday, Second Day.

There is an immense throng of visitors in the city to-day, which will doubtless be greatly augmented to-morrow. The display in the Pavilion is emerging from the chaos of yesterday and is rapidly assuming a charming and most attractive appearance. The fruits are now mostly upon the tables and are the admiration and wonder of Eastern visitors particularly, of which a considerable number are present.

A grand stock parade was had at the Park today, of which Californians have reason to be proud, for here, from mountain and valley, hill and plain, the length and breadth of the State, are collected many of the finest specimens of thoroughbred animals in the world. Among them the noble short-horn stands preeminent for size, docility and beauty, and is largely represented. Alderneys, Ayershires and Jersoys, are also creditably represented in numbers and command a full share of curions and critical attention, gems as they are among the bovine family for cheese and butter yielding qualities.

The number of fine horses on exhibition run up into the hundreds, embracing roadsters and trotting horses, racers, brood mares and colts in large numbers. It is evident from the attendance at the grand parade of stock to-day and the satisfaction apparent everywhere and with all classes, the ladies included, that the daily display of animals at the stock grounds, is every year becoming more and more a prominent feature of our agricultural fairs. The races to-day were witnessed by a largely increased number over yesterday, and seem to draw upon all classes more completely than any other one feature of the Fair.

The attendance at the Pavillion, however, in the evening was large, the display vastly improved over that of yesterday, and universal satisfaction at the very creditable display, is everywhere manifest.

Wednesday—Third Day.

Visitors are still pouring in to the already burdened city, and the wonder is where any more are to find accommodations; but the increased facilities provided by the citizens generally for the occasion, will doubtless be fully equal to the emergency, and all will find a place. Whether all will be comfortable is quite another matter, for the heat is simply unbearable with any sort of patience. Still there seems no flagging of interest in all that pertains to the successful prosecution of the grand carnival.

The Regatta of to-day brought out a large attendance and conduced to a most exciting and enlivening scene. The races as usual were immensely patronized, and the Pavilion thronged with spectators, evidently, in the main, *not* to listen to the President's Address, but to see and be seen, quite regardless of the buz and hum occasioned by the movement of countless feet upon the uncarpeted floor. We shall endeavor to give the address in a future number.

A Training Ship and Labor Schools.

The question "What shall we do with onr hoys,?" which has heen uuder discussion for some time in this city, has not yet been decided. A "Deliberatives Assembly" was orgenized, which bss teken the suhject under advissment. This essembly is now in session in this city. On ths 10th inst, the committee on "Training Ship" reported and reed the following hill for a lew to estahlish labor schools in our community.

The Bill and Its Provisions.

An Act supplementery to, end amendatory of, the several acts in relation to the Public of Common Schools, conteined in Volume 1 of the Political Code of California, Chapter 3, Sections 1,517 and following, and "An Act to provide for ths support of the common schools of tbs city and county of San Francisco, end to defins the powers and duties of ths Boerd of Educatiou thereof," epproved April 1, 1872.

The people of the State of California, represeuted in Senate and Assembly, do enact as follows:

Section 1. The Board of Education of the city and courty of San Francieco shall have power—

First, To connect with the common schools which now exist in said city and county of San Francisco, and which may be hereafter estahlished therein, a syetem of mechanical lahor, to he taught in the said schools hy competent persons ekilled in the several branches to be designated hy said Board, in pursuance of the provisione of this act.

Second, To fix the salariee or compensatione to be paid the several instructors, hoth male and female, who shall be employed in the mechanical departments of the said schools, and the amount of compensation that ehall be allowed to said instructors, shall not be less than that allowed to principals of the grammar schools in eaid city and connty.

Sec. 2. The hranches of mechanical labor which ehall first be taught in said schools shall be those that require small capital, small space, and the prosecution of which is not attended with much noise; euch as printing, bookhinding, tailoring, ehoemaking, peper hox making, and the like trades. And in the femsle schoole, cutting, fitting, and making garments for females and children, and tbe use of sewing machines.

Sec. 3. No pupil shall he required to receive instruction in any mechauical business or trade nntil he or ehe shall have entered a grammar class; after which he or she shall be required to devote not less than one-third of the time designated for school hours in receiving iuetruction in mechanical labor.

Sec. 4. The Board of Edncation of said city aud county is hereby authorized and directed to cause to be provided, ae soon as practicable, suitable apartments or buildings either witbin or adjecent, or convenient to the public school honses, with the necessary stock, materials and machines required for operating the several trades, whicb may be introduced into the common schools of said city and county, and to appoint the necessary instructors for that purpose.

Sec. 5. Section 9 of the Act to provide for the support of common schools, approved April 1, 1872, is ameuded as follows: The Board of Education of the City and County of San Francisco is hereby authorized and directed to procure a ship of snitable size and tonnage, with all the necessary tackle, furniture and equipments, on board of which to instruct uot less than two hundred boys of depraved character in seamanship and mechanical tredes, to be called a "Training Ship." Said ship shall be anchored in the Bay of San Francieco, within the corporate limits of said city, except during such time as she may be employed in cruising, for the instruction of the pupils on hoard; and to supply said ship with all the stock, materials, implements and machines necessary to operate efficiently, the trades and business which shall be taught on board of said ship; and the eaid Board is hereby authorized to apply to the United States Government for tbe use of vessels and supplies for the purposes above meutioned.

Sec. 6. Said Board shall adopt rules and regulations for the government, inetruction and reformatiou of the boys placed on board of ssid ship, appoint all necessary instructors and employés required to perform the various duties designated by said Board, fix their salaries and compensation, and require the Principal or Superintendent to furnish to said Board quarterly reports of the number of pupils, their character, deportment aud progress.

Sec. 7. Said Board is herehy authorized to remove from the Industrial School, in said city and county from time to time, those boys who are most depraved, and place them on the Training Ship, and to classify and grade those that remain in said school, according to their moral character and geueral deportment for good conduct, so that the more vicious shall not corrupt those of lese evil tendenciee and habits, and that the several classes and grades shall be kept and instructed in separate apartments.

Sec. 8. That said Board ie herehy authorized (whenever a majority of two-thirds of all its members shall so determine) to establish in said city and county a school to be called "The Polytechnic Institute," in which shall be taught mechanical engineering, civil engineering, architecture, drawing and deeign, chemistry, and such other branches of scientific knowledge as may tend to qualify the pupils for the practicel husiness of life, and to provide the buildings, furniture, fixtures, apperatus, mschinery, and all tbe uecessery materials required for tbe efficient prosecution of said studiss, and to appoint tbe necessary professors, instructors, and all other ageuts and servants, and to fix their salaries and compensation, and to prescribs their duties; hut no pupils shall be received into said Instituts who ars not graduetes of the High School eud are adjudged by ths City Boerd of Examination to possess particular aptness in ecqniring soms or all of the hranches teught in said Institute; *Provided*, that the amount reqnired to estab·lish provide all the hnildings, furnish all the materiels, machinery, furniture and fixtures, and pey all the expenses of seid institution from year to ysar after said Institute shell be put in operation, shall not exceed one hundred and fifty thousand dollars in gold coin of the United Stetes, which said sum shell be provided as prescrihed in section 20 of the act approved April 1, 1872, the honds required to he issued heing mede payeble ten years after the date of issuance.

Sec. 9. All the powers and authority conferred upon the Boards of Eduestion and Supervisors of the City and Ccuuty of San Francisco, and the dutiee enjoined therenpon by the several provisione of the act approved April 1, 1872, to whicb this act is supplemental and amendatory, are hercby made applicable to this act, eo far as they may be necessary to carry out fnlly its provisions.

Sec. 10. The Boards of Trustees in the several counties of the State, and the Boards of Edncation in the sevcral cities tbereof, are hereby authorized and empowered to connect with the public Schools in said cities and counties, and canse to be taught therein, mechanical labor, in pursuance of the provisione of this Act; and all the provisions of said Act, having reference to, and which confer authority upon the Board of Education of the City and County of San Francisco, so far as the same will apply, are bereby made applicable to the cities and countiee of said State; and the Boards of Supervisors of the said counties are hereby anthorized and directed to levy a sufficient tax, in addition to that heretofore authorized to he levied, to meet the necessery expenses that may be incurred under Section 10 of thie Act.

Sec. 11. The City Board of Examination for the city and connty of San Francisco is hereby authorized and directed to examine all those pupils (graduates of the High School in said city) who may from time to time apply to be admitted to the Polytechnic Institute; and those who shall be found to be qualified in pursuance of the provisions of Section 8 of this Act, shall receive from said Board a certificate expressing said qualification, which shall admit them into said institution, and entitle them to all the privileges of said institute.

Sec. 12. All acts and parts of acts, so far as the same may he inconsistent with the provisions of tbis act, are hereby repealed.

Sec. 13. This act ehall take effect and be in force from and after the date of its passage.

Reserved for Consideration.

The committee also reported the following resolution:

Resolved, Thst the Act jnst reported be laid upon the table, and that the publishers of newspapere in this city and State, favorable to the objects expressed in said Act, are hereby respectfully requested to pnblish it, with such comments and snggestions as to them may seem proper, to the end that this Assembly may be aided and assisted in perfecting an act to be presented to tbe Legislature for its adoption.

After considerable discnssion, the resolution was adopted unanimonsly. The next meeting of the Assembly will be held at the Police Conrt Room on the 24th inst., and every Wednesday evening thereafter, until the bille are complete and ready to be presented to the Legislature.

Skillful Navigation in a Fog.

A correspondent to the Boston *Advertiser*, who writes from London, after completing his voyage across the Atlantic, says: The Siberia, of the Cunard line, sailed from Boston, July 1st, on the new southerly course for Liverpool, and striking iuto the fog on the first day out, did not meet with fifteen minutes clear weather, when an obeervation could be taken, for almost eight days. But no paius were spared by the officers to make the dead reckoning accurate. The log was thrown every two hours, day and night. On the evening of the eighth day, our latitude was estimated to be north 49°36′, but the fog was still dense enough for the fog whistle to be blown. A little later it lifted very suddenly, then the clouds broke, disclosiug the pointers of the Dipper, and a moment later the North Star itself was visible. The chief officer hastened for his sextant, carefully took the altitude of the star, aud found it to be 49°36′ to a second. And on the tenth day we csme in eight of the Skillings, and hore up the coast of Ireland to the Fastnett Light without chsnging the course a fraction of a point. And this was the first time the Siberia had sailed upon the new couree, and during three-fourths of the time she had been enveloped in fog.

It is estimated thst themills in California consume 61,700 pounds of quicksilver per month.

Astronomical Notes.

Tbe intra-msrcurial planet still keeps up astronomical discussions. Leverier, whose celculations on the irregularities of the farthest planet Uranus led to the discovery of Neptune, still fartber off, deduced, in 1851, from irregularities in Mercury's motion, thet another planet mnst exist still nearer to the sun; but as there are yet no well authenticeted evidencss of ths transit of this planet over the sun's disk, estronomers in general will not commit themselves in favor of or egainst its existeuce. Prof. Kirkwood is now inclined to accept the existence of two intra-mercurial plenets—one of a period of 36 deys, the other of 16 days; while Prof. Alexandsr even argues ths existencs of a gronp of plenets at a distance of 20,000,000 miles from the snn, or ahout one-fifth of the distance of our eerth from the sun.

Thet ths sun hed in Juns, last year, an infusion of maguesium vapor into its atmosphere is verified from the concordant results of various investigations. It appears, therefore, that our sun is by uo means an immutahle source of light snd heat, hut is suhject to ontbursts of conflagrations of diverse materials as well es the stars, for instance, that in the corona borealis, which a few years ago suddenly increased twenty times in hrightnees by a great conflagration of hydrogen. If a similar thing happened to our sun there would at once come an end to all our specnlations, rivalries, wars, empires, etc., and our earth be thrown hack in one of those stages of her gcological history wheu organic life did not yet exist.

The atmosphere of Uranus has been fouud to consist chiefly of hydrogen, as proved hy the spectroscope. This iuvolves an ahseuce of oxygen, or a hydrogeu fire, continnally hurning at the present time. In either case, organic life, like that ou our planet, can not exist on Uranus; while also its ahsence on Jupiter aud Saturn is proved.

The one hundred and thirty-first little planet wes discovered in Washington, and the news of its discovery and its correct position at once transmitted by cable to Europe. From Paris the news was at once transmitted to all tbe astronomical observatories in France, aud that at Marseilles was the first to find it tbe same evening that the dispatch was received. It is very remarkahle that the thirty-first of these planete was, in 1854, also discovered in this country, where the oue hundred and thirty-first was discovered this year—nineteen yeare later.

We remind those of our readere not posted in astronomical metters, that the space between the orbite of the planets Mere and Jupiter, for many centuries eupposed to be vacant, was at first found to be filled, not by the orbit of one planet, bnt hy that of four planets, which were called Pallas, Ceres, Vesta and Juno, and that later many more fragments of smaller size were discovered. It was at first snpposed that one planet primitively occupying that orbit had exploded like a bomb-shell into the fragments now found; but tbe modern theory is that all tbe planets have slowly been built up from such fragments, gradually coming together by gravitation, aud that in the case in question this hae not yet taken place. It is supposed that every planetary orbit was primitively a ring consisting of millions of solid meteorites, as still is the case with the ring of Saturn; that theee gradusslly have coalesced hy gravitation and formed hundreds of larger masses, ae is the case with the belt of tbe 131 or more planets in question, (also called asteroids,) and that finally these masses, gradually dimiuishing in numbers and individually increasing in size, leave at last either a single one, as is the case with Mercury, Venus and Mare, or two, as is the case with our Eartb and Moon, or any other number; for instance, five, as we eee in Jupiter and its four moons, or more, as ie the case with Satnrn, Urauus, Neptune, or other planets which may yet be discovered outside of the orbit of the lster.—*Manufacturer and Builder.*

Water in the Mines.—The Butte *Record* says: Tnrton & Knox hsve fourteen white men and thirty Cbinamen at work on their extensive reservoir at the hesd of Bnsh creek, in Plumas county. The *National*, speaking of thie enterprise, says the water-right formerly belonged to Jabe Serrin, who sold to Turton & Knox. These gentlemen are erecting at the point mentioned a capacions reservoir, with a dam, which will be forty feet high. The work will be completed in two months, and will carry a large volume of water to the rich claims along the east branch of the North Fork of Feather River. The great desideratum in this region is water. For many years the patient miuers of Butte, Yubs, Sierra, Plumas and Lassen counties have strnggled to hold their claime, and eudured great privations, sustained always by the knowledge that they possessed the richest gold placers on this planet, and buoyed up by the hope that some day enterprising capitalists would assist them in unearthing the precions treasnre. The attention of capital is at last turned thitherward, and the time is not far distant when the roar of the hydraulic pipe will be heard in every gulch and ravine in that rich mining district.

The stagnation of Freuch metallurgical affairs has become more decided, and extends to all the centers of French metallurgical indnstry. While fnrnaces are being blown out in in the Champagne group, new ones are being equipped in tbe Meurthe et Moselle district.

The Louisiana sugar crop of 1872 wes a smell one, compared with tbe previous years, yielding 108,520 hogsheeds, whils in 1871 tbe yisld wes 128,461 and in 1870 144,881 hogshesds. The rehellion broke np this brench of agriculturs, which the year before, tbe war, yisided 459,000 hogsheads. In 1870, however, it hegan reviving, hut political troubles and other ceuses conduced to a decline lest year. This year's crop, which is now growing, we are informed, covers more surface than lest year's, end is expected from present indications to bs a hetter ous thsn that, altbough, like every crop this ssason, it is backward.

TO THE PUBLIC.

THE PAIN-KILLER manufactured hy PERRY DAVIS & SON has wen for itself a reputation unsurpassed in medicinal preparations. *The universality of the demand* for the Pain-Killer is a novel, interesting and surprising feature in the history of this medicine. The Pain-Killer is now regularly sold in large and *steadily increasing* quantities, not only to general agents in every State and Territory of the Union, and every Province in British America, hut to Buenos Ayres, Brazil, Uraguay, Peru, Chile, and other South American States, to the Sandwich Islands, to Cuha and other West India Islands; to England and Continental Europe; to Mozamhique, Madagascar, Zanzibar, and other African lands; to Australia, and Calcutta, Rangoon and other places in India. It has also heen sent to China, and we doubt if there is any foreign port or any inland city in Africa or Asia, which is frequented by American and European missionaries, travelers or traders, into which the Pain-Killer has not been introduced.

The extent of its usefulness is another great feature of this remarkahle medicine. It is not only the hest thing ever known, as everyhody will confess, for bruises, cuts, hurns, etc., hut for dyseniery or cholera, or any sort of howel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of British India and the West India Islands and other hot climates, it has become the *standard medicine* for all such complaints, as well as dyspopsia, liver complaint, and other kindred disorders. For coughs and colds, canker, asthma and rheumatic difficulties, it has heen proved hy the most ahundant and convincing trials and testimony to ho an invaluable medicine. The proprietors are in possession of letters from persons of the highest character and responsihility, testifying in unequivocal terms to the cures effected and the satisfactory results produced, in an endless variety of cases, hy the use of this great medicine. That the Pain-Killer is deserving of all its proprietors claim for it is amply proved hy the unparalleled popularity it has attained. It is a *sure* and *effective* remedy. It is sold in almost every country in the world aud is becoming more and more popular every year. Its healing properties have heen fully tested all over the world, and it need only to be known to he prized.

Sold hy all Druggists. sep13

Send for Circular.

DEWEY & CO.,

Mining and Scientific Press and Pacific Rural Press Office, 338 Montgomery St., S. F.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees; list of Goverment fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

The Mining and Scientific Press Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily the which interests them most.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum. Single copies, post paid, 10 cents. Address

DEWEY & CO.,
MINING and SCIENTIFIC PRESS and PACIFIC RURAL PRESS Office, 338 Montgomery St., S. F.

A NEW BOOK.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 640 Pages and 81 Engravings.

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Six Years.

PRICE, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Address all orders (wholesale or retail) to

DEWEY & CO.
338 Montgomery street, San Francisco.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. 1ambp

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS
ALSO, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & Co., Publishers, and Patent Agents, S. F.

PROPOSALS FOR MATERIAL

FOR A PORTION OF THE

New City Hall Building.

OFFICE OF THE BOARD OF CITY HALL COMMISSIONERS, corner of Leavenworth and McAllister streets, San Francisco, July 19, 1873.

SEALED PROPOSALS, For Furnishing certain material for a portion of the New City Hall Building and Hall of Records, will be received at the office of the Board, until 12 o'clock, noon, of WEDNESDAY, the 1st day of October, A. D. 1873, for the following:

ROLLED IRON JOISTS,
WROUGHT IRON GIRDERS,

All according to Specifications, Schedule, Plans and Drawings, to be furnished by the Board.

No Bid will be entertained unless made on the "Printed Forms of Proposal," and accompanied by a bond with two good and sufficient sureties, in a sum equal to 10 per cent. of the total sum of the tender, conditioned for the due entering into the contract of the party to whom it may be awarded.

The Bids must be endorsed for the Material proposed to be furnished, and addressed to the Secretary of the Board.

The Specifications, Schedule, Plans and Drawings can be seen, and all further information obtained at the office of the Board, where also Forms of Proposal will be furnished to intending bidders.

The Board reserves the right to reject any or all bids.

Payments will be made monthly, in "City Hall Warrants, of 75 per cent. of the estimated amounts due, and the remaining 25 per cent. when the contract is completed.

The expense of advertising will be charged pro rata to the successful bidders.

P. H. CANAVAN,
JOS. C. EASTLAND,
CHAS. E. McLANE,
Board of City Hall Commissioners.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gotbard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A.....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Roebling.....East River Bridge Company, N. Y.

For further information, etc., address

Dr. BRENAN.

Dr. Paul M. Brenan, the celebrated Physician, Lecturer and Surgeon, has now permanently established himself in San Francisco; offices, 127 Montgomery street, where he can be consulted free of charge, upon all diseases and weaknesses to which mankind is liable, including Nasal Catarrh, affections of the Head, Chest, Throat, Lungs, and Heart Neuralgic and other nervous diseases. Dr. Brenan is also able, through his thorough knowledge of Physiognomy and Phrenology, to read a man's character at sight, advising him of his principal characteristics, and what path of life it would be best for him to pursue. Phrenological examinations given daily. Correspondence promptly answered.

Private and confidential correspondence may be addressed to lock box 291, post office, S. F.

Offices—127 Montgomery street. Hours, 10 to 12 A.M., 2 to 5 and 6 to 8 P. M.

The Poor prescribed for free every Thursday afternoon. 9v27-3m

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is uncqualled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

Publishers, Patent Agents and Engravers,

338 Montgomery street, S. F.

September, 1873.

OFFICE of Dr. Lane, Surgeon and Physician, also Fire, Life and Accidental Insurance Agent, Mendocino City, Cal., August 28, 1873.—Messrs. DEWEY & Co.—Gentlemen: The Letters Patent have been received, also the copies of Specifications, for all which many thanks. Since I received my patent I get more letters and circulars from patent agents and brokers than is essential for practical purposes. One I just received from * * * *****, who claims to have an office near you; and, taking his word for it, would suppose him the only man capable of obtaining a foreign patent. All right! I shall make it a principal point to see you as soon as I arrive in the city. Yours truly, N. W. LANE.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

L. P. MCCARTY—General Agent.
A. O. KNOX, City Soliciting and Collecting Agent.
W. H. RATTENBERRY—California.
F. G. SACKET—Northern California.
FRANK CHAPIN—Oregon and Washington Territory.
L. M HOLT—Sonoma Co., Cal.

GENERAL MERCHANDISE.

WEDNESDAY NOON, Sept. 17, 1873.

Bags and Bagging are still weak. Rice is also in too great abundance to meet with ready sales and fair rates. One cargo was actually shipped back to China. Coffee is firm, with an upward tendency, sympathizing with the Eastern market. Prices of Soap remain unchanged, but considerable activity is felt. The Standard Soap Company are selling an article, called the "Carbolic," used as a sheep wash, at 12½ cts per gallon, and at $9 per dozen for 5 lb caddies. Oils are steady, some of large's Devoe's Petroleum, at 37 to 39 cts, according to style of can.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

California Silk Manufacturing Company—

Principal place of business, City and County of San Francisco, State of California. Location of works, City and County of San Francisco, State of California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 29th day of August, 1873, an assessment of Five Dollars per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at his office, No. 569 Market street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the first day of October, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 20th day of October, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. D. M. BOKEE, Secretary.

Office, 569 Market street, San Francisco, Cal.

The Confidence Mining Company—Location of works, Tuolumne County, State of California.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 1) levied on the 4th day of August, 1873, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Ortificate.	No. Shares.	Amount.
H E Halsoy	8	100	$175 00
J L de Pourtales	9	200	350 00
H Hampton, Trustes	32	250	437 50
H Hampten, Trustes	37	100	175 00

And in accordance with law, and an order of the Board of Directors, made on the 4th day of August, 1873, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, on Monday, the 22d day of September, 1873, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

H. HAMPTON, Secretary.

Office—217 Sansoms Street, San Francisco, California.

se6

Day Spring Gold Mining Company----Location of principal place of business, city and county of San Francisco. Location of works, Kelsey Quartz Mining District, El Dorado county, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the Fourth day of August, 1873, the several amounts set opposite the names of the respective shareholders as follows:

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,

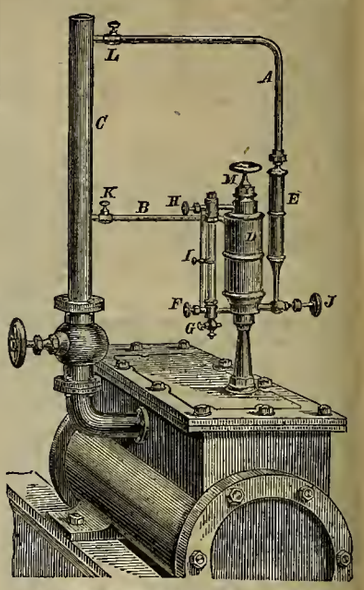
10v27tf No. 32 FREMONT STREET.

N. Seibert's Eureka Lubricators.



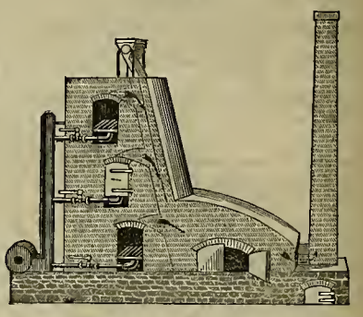
☞ THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

Metallurgy and Ores.

EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

5v27-3m Superintendent.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, nr will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

NICKEL PLATING.

[MINING SUMMARY — Continued from Page 181.]

various ore breasts are looking well as usual, with no new developments to note.

UTAH.—The pumps and pumping engines have been placed in position and are working splendidly, and the sinking of the main shaft is progressing rapidly.

CROWN POINT RAVINE.—The body of ore recently found at the 250-ft. level, 90 ft. south of the shaft, still shows finely and gives excellent assays.

SUCCOR.—Owing to the increase of water, the progress of work in the small new shaft, near the mill, is considerably impeded at present.

MINT.—The ore indications in the cross-cut from the main east drift at the second station continue looking very favorable.

CHOLLAR-POTOSI.—Daily yield 130 tons, ore improving in quality. It is being reduced at the Land, Winfield and Nevada mills.

OVERMAN.—The pumping and other machinery at the 1,100 ft. station being completed, sinking the shaft is resumed with good progress. The main west tunnel, at the 1,000-ft. level, together with its southwest and northwest branches, is making good progress toward where good ore should be found some day or other.

ARIZONA & UTAH.—The sinking of the shaft and incline is progressing rapidly. Passably good rock is being encountered in the shaft. Some low grade ore has been encountered. Prospects flattering.

HALE AND NORCROSS.—Daily yield from 40 to 50 tons of ore of medium quality, from the upper levels of the mine. Sinking the main incline has again been resumed, but as the winzes already extend 100 ft. below the present depth of the incline, a considerable period must elapse before any development can be expected from this quarter. Prospecting shafts are being extended at the various levels, none of which as yet have shown results worthy of note.

GOULD & CURRY.—About 40 tons of pay ore extracted daily, which is being worked at the Mariposa Mill. The various prospecting drifts and cross-cuts are being pushed ahead with every possible dispatch. The heavy flow of water has nearly abated. Four large boilers arrived yesterday and will soon be placed in position.

JUSTICE.—Drifting, both north and south, at the 400 ft. level, in the Waller Defeat section. The face of the east drift is in softer rock, showing small stringers of quartz, with clay seams. The 300 ft. level, north works, is 150 ft. north of the main shaft, and shows about 3 ft. of good milling ore, which increases and improves as farther drifted upon.

BALTIMORE CONSOLIDATED.—At the first or 225-ft. level the ore holds out well, and occasional bunchos of a very high grade article are met with. At the second and third levels work is progressing as usual with a view to anticipated good ore developments.

Arizona.

SWANSEA.—Arizona *Miner*, August 29th. We had the pleasure the other day of taking a look through the Swansea Works, with the Manager. The arrangements for desulphurizing the pyrites are very perfect, and do their work well—the bright yellow iron that goes into the furnaces coming out almost as black as ebony, and deprived of nearly all the sulphur. This is subsequently carried by a railroad to the smelting furnace, where it is subjected to an intense heat, all the valuable metals being drawn off together in to matte or "regulus"—the gold, silver, copper and lead all being saved,—while the slag, which floats on the molten mass, is drawn off above. We found the roasting furnaces in full operation, and the sulphurous fumes which filled the air in the vicinity admonished us to see all we could in a very short time. The smelting furnace was receiving a new roof of fire brick, but will be in full blast again next week. These works are adapted to the treatment of pyrites. The matte has hitherto been reparated at Swansea, Wales, but will perhaps hereafter be treated in our own Territory.

SPECIMENS.—Jesse S. Randal has just received from his father, 400 pounds of specimens gathered in San Louis Park. Among them are some of the largest and finest pieces of chalcedony we ever saw; also fine specimens of obsidian, alabaster, pearlstone, and some unnamed varieties of volcanic rock. He has also received a number of ore specimens from the San Juan mines, and from Lake District.

THE Marshall Silver Mining Company are driving their various drifts, shafts and stoping at a lively rate now-a-days. Gen. M. informs us that there are now employed in the various workings of the Company's property a force of fifty-four men.

MAGNOLIA.—A shaft on the Magnolia lode, on the east side of Leavenworth mountain, 20 ft. deep, shows 2 inches of ore in the bottom, and a drift of 25 ft. shows mineral all the way. A small lot of second class ore from this shaft, treated last Saturday, showed a yield of 471 ounces per ton.

THE Peruvian mine, at Peru, opened by a cross-cut, shows from 3 to 6 ft. of crevice carrying galena, at 19 ft. It is owned by Johnson, Honsen & Shepherd.

OUR minors are to be represented at the Fair. No doubt on that point. Messrs. Streeter & McCunniff's contribution from the Pelican mine can be seen in front of the bank. It is a chunk of mineral weighing 1,572 pounds, and showing to very good advantage the different kinds of ore found in the vein, together with small pieces of porphyry embedded in the ore.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

McGILLIVRAY HYDRAULIC M. Co., Sept. 16.—Location: Trinity Co., California. Directors: Geo. A. Lathrop, George H. Mendell, Isaac E. Davis, Barnum W. Field, Winfield S. Jones. Capital stock: $100,000; in shares of $100 each.

STANISLAUS RIVER M. Co.—Object: To work the bed of the Stanislaus River, on certain portions thereof, for auriferous deposits. Directors: Thos. Derby, J. W. Harrison, B. B. Minor, L. Jaffe and William Stuart. Capital stock: $1,800,000, in shares of $100 each.

Meetings and Elections.

CALIFORNIA CONSOLIDATED M. Co.—Location: At the California, Illinois and Gold Tunnel claims in Nevada County. Directors: John W. Gashwiler, Joel F. Lightner, J. D. Fry, J. H. Helm and John F. Boyd. Capital stock, $4,000,000, in shares of $100 each.

Showing the location of some 400 mines and tunnel sites, together with the mines surveyed for U. S. Patent. Price $3. For sale and mailed to any part of the globe, on receipt of price, by A. L. BANCROFT & CO., A. ROMAN & CO., and LECOUNT BROS. & MANSUR, San Francisco. 10v25-tf

Parshall's Lubricator for Steam Engines.

These Lubricators are suited to all steam Engines, delivering the lubricant, whether tallow or oil, to every kind equally well. They are subject to be placed in the steam pipe, steam chest cover or the cylinder head, as is desirable. They admit the steam freely to the lubricant, which is constantly saturated with it and kept thereby in a free liquid state. When condensation of the steam begins, the water settles below and raises the oil to the top. The oil is fed from the top of the cup, through a tube which passes down through its center. All sediment in the oil settles to the bottom of the cup, and the oil, on going to feed the engine, is always pure. By simply turning a screw in the top of the cup, the flow of oil is regulated to suit the requirements.

We have numerous testimonials from Railroad Engineers and others, speaking in the highest terms of their superiority. The first one put in use on this coast is at the Pacific Saw Manufactory in this city. Parties desiring further information will please send for descriptive circular and price list, or call at our office.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freihurg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two shoes per five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 23, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,

113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, SEPTEMBER 27, 1873.

VOLUME XXVII. Number 13.

The Alaska Gold Mines.

We have several times alluded to the gold mines discovered in Alaska and recently received from A. H. Prince, Secretary of the Alaska Gold Mining Company, several specimens of the ore from those mines. He writes us that there are at present only two ledges being worked—Mooney's and the Alaska Gold Mining Company's. Mooney's is situated about nine miles down Silver Bay, about 100 yards from the beach, alongside of which vessels of any size can go. Work was recently started up in this claim. The ledge is well defined and some very good looking rock is coming out.

The ledge belonging to the Alaska Gold Mining Company is situated on Cedar Creek, about two and a half miles from the head of the bay, 14 miles from Sitka, but a shorter and better road to the mine will probably be soon built, which will lessen the distance one-half. The ledge is held by a party of seven. Up to the present time a short tunnel has been run, the rock looking well, being in most places heavily charged with ore. Two tons of this ore have been sent to this city to be crushed. The rock sent is said to be fully equal, if not superior to that sent to Mr. Fisk, an assayer in Portland, and which gave returns of from $100 to $276 to the ton, in gold. Mr. Prince says that if the ore turns out as well as they expect, and gives a fair yield they have plenty more on hand ready to ship. A quartz mill is needed there but the miners being all poor men, they are unable to procure one,

The whole district where the mines are found abounds in quartz ledges. Numerous discoveries have been made, and Mr. Prince writes that they have found copper, cinnabar, silver and coal in different places. The discoverers all being poor men, they are unable to do anything with the locations, but are, like many other miners, waiting for capitalists to help to develop the miners' fields of our new Territory.

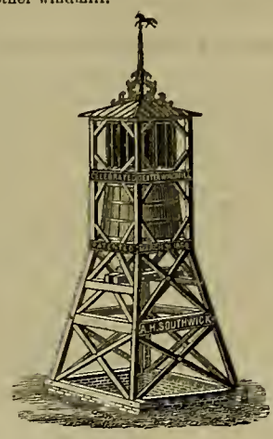
A prejudice exists against the climate of Sitka, but Mr. Prince says it is not as bad as painted. Out door work, he says, can be prosecuted all the year round, the same as elsewhere. Living, he tells us, is as cheap as at any place on the coast. Venison sells for 50 cents per quarter, salmon, when in season, from 15 to 25 cents each. There is plenty of good timber and water everywhere. The Indians are peaceably disposed and work for 50 cents a day. The rock sent us is a white quartz sprinkled with free gold, and very much resembling the class of ore coming from some of the San Diego mines. It can be seen at the editoral rooms of this journal, 414 Clay street.

The Kimball Manufacturing Company of this city, received a gold medal at the Vienna Exposition, for the best light carriages exhibited. The medal for heavy carriages was awarded to a Vienna firm. The carriage exhibited by the Kimball company was a C-spring wagon, weighing 125 pounds, which has been described at length in our columns, by our correspondent in Vienna during the exposition. Mr. Knetel wrote us that many of the people there did not believe that the vehicle was intended for use, but merely for show, as they had never seen such a gossamer-like conveyance before. Two persons had to ride in it before the committee of awards in order to prove to them that it would hold grown-up people.

The telegraph reports the discovery of an immense cave in the Fuller mine, Little Cottonwood, Utah, 225 feet deep, exposing large deposits of mineral. There is said to be much excitement over the matter.

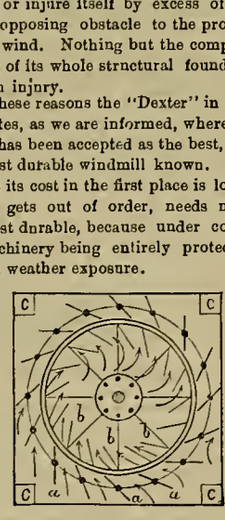
The Dexter Windmill.

In our engraving we present an illustration of the celebrated Dexter Windmill, which to the people of California is comparatively unknown. A peculiar feature of this and one which distinguishes it from all other of the more common windwheels consists in its being always ready to take the wind, come from what quarter it may. Its shaft being vertical instead horizontal, and resting upon a hardened steel point running in oil, it has less friction than any other windmill.



In addition to the merit of being always ready for the wind, it is always in order and regulates its own speed. It requires no care or watching during the most violent gale, because its construction is such that it cannot be injured or injure itself by excess of speed, or as an opposing obstacle to the progress of a violent wind. Nothing but the complete overturning of its whole structural foundation can work an injury.

For these reasons the "Dexter" in the Eastern States, as we are informed, wherever introduced, has been accepted as the best, cheapest, and most durable windmill known. Cheapest, because its cost in the first place is low, and as it never gets out of order, needs no repair. The most durable, because under cover, itself and machinery being entirely protected from sun and weather exposure.



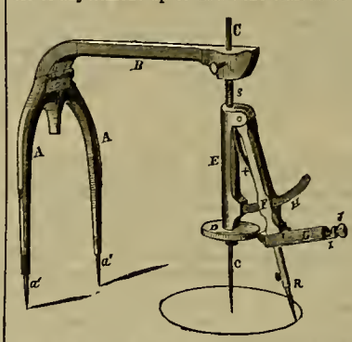
The above cut is a lower sectional view, showing the position of the shutters and fans, as also the direction and action of the wind upon the wheel, as indicated by the arrows. By noticing the arrows it will be perceived the wind acts on every part of the wheel, either going in or passing out. For private residences it is simply unequalled, being a thing of beauty instead of an ungainly, rickety, noisy concern. At the late California State Fair, the "Dexter" was awarded the Society's Diploma.

Full information regarding it can be had on application to A. H. Southwick & Co., 408 California street, San Francisco.

An Improved Ellipsograph.

The accompanying cut is a representation of an improved ellipsograph, the invention of Andrew Smith of Dayton, Oregon. The object of the invention is to provide a simple and effective instrument for drawing ellipses, and it is so constructed as to be adjusted to produce figures of any practicable size and shape. The mode of operation can be seen by reference to the cut. *A* is a bifurcated standard, arranged with its forked end downwards and terminating in sharp brads, a', a', which hold the instrument firmly on the paper or drawing card. At its upper end this standard terminates in a hinge which connects it to a horizontal arm, *B*. *C* is an upright metalic staff terminating at its lower end in a needle, c, which sticks into the drawing paper and with the two needles a', a', holds the instrument in position.

A short distance above the needle and capable of adjustment up or down the staff so as to



SMITH'S IMPROVED ELLIPSOGRAPH.

enlarge or diminish the figures without changing their shape, is a pattern, *D*, of elliptical shape. At its upper end the staff extends through the end of the arm, *B*, and may be clamped in any position by means of a set-screw. This staff, thus constructed and attached to the arm, *B*, serves to support a vertically-sliding and horizontally-revolving block, *E*, which is pressed downwards by a spring, *s*, at the upper end. This block is provided with legs, *e*, to which is joined an arm, *F*.

The arm, *F*, at its lower end is attached to, and supports, a nearly horizontal piece, *G*, that serves, among other uses, as a handle by which to rotate the arm, *F*, and its supporting block, *E*, about the vertical staff, *C*. The inner end of the part, *G*, presses against the periphery of the pattern, *D*, against which it is held by the action of the spring, *t*, A curved guide and brace, *H*, attached to the block, *E*, extends through a slot in the arm, *F*, and may be employed to prevent the joint at *e*, from injury by torsion. In a groove in the under side of the piece, *G*, is fitted a metalic slide, *I*, which can be adjusted in or out with reference to the spindle, *C*, by a thumb screw, *J*. The pencil, *R*, is attached in the usual manner.

The under side of the part, *G*, may be graduated so that the effect which any movement of the slide, *I*, will have upon the figure to be drawn may be accurately calculated before hand. The advantages claimed for this instrument are—that the legs support it firmly, the joint or hinge admits of its being folded into small compass; easy adjustment of the pencil; ease of adjustment; convenience in moving the pencil, etc. Wieeter & Co., No. 17 New Montgomery Street, will furnish further information concerning this instrument if desired.

Encouragement to Inventors.

The St. Joseph Industrial Fair which is to be held at St. Joseph, Mo., beginning on the 29th inst., offers some features which might well be adopted by similar associations all over the country. The Board of Directors believe that patentees and owners of patents deserve more than a mere passing notice at Expositions, and that it is not more than justice to have arrangements made by which visitors can obtain all the information they desire about each model, machine or invention, and inventors can dispose of their patents or bring their models or machines before the public to the best advantage. To accomplish this desirable feature, the association holds out special inducements to inventors and owners of patents only. They give quite a lengthy list of inventions and state that a gold medal will be given for the best and most useful in the list, and silver medals in *each* of the classes as well as a large silver medal for any useful invention not mentioned in the list.

Inventors are allowed to advertise in the building and have their full address and price attached to any model or full sized machine and are allowed to state what territory is for sale, if any. Goods, models or machines are placed in the building free of charge, and arrangements have been made with the express companies to have them forwarded at lower rates than usual. The managers of all the fairs ought to take special care to encourage inventors and induce them to bring their models or inventions to the Exhibition. It would not only benefit them but the inventors also, who are generally rather impecunious. When people see a number of machines of the same class, together, they can judge of the relative merits of each one and which would suit their needs the best. Inventors generally speaking have considerable difficulty in introducing their inventions, and anything which will encourage this most useful class of the community to renewed efforts, aids materially the progress of civilization, and redounds to the honor of our country.

"The Graphic" monster balloon which was to have crossed the Atlantic, was a failure and did not start according to programme. There seems to have been some feud between the parties interested and Prof. Wise, the æronaut, says that the agreements made by the *Graphic* people with him, were not carried out by them. The balloon was not constructed of the material he suggested, nor in the manner he suggested. Popular opinion is to the effect that the whole affair was a gigantic advertising scheme, but Professor Wise says he is ready to make the attempt to cross the Atlantic if he has a reliable air-ship. It is to be deplored that the balloon did not go, as there is but little doubt but that important scientific data could have been obtained.

Good Work.—The upright engine now being constructed at the Pacific Iron Works for the Pacific Rolling Mills, is the largest stationary engine yet made on the coast. The fly-wheel is an enormous casting, and weighs twenty-five tons, or fifty thousand pounds—not twenty-five thousand, as erroneously stated by a morning cotemporary. The whole work is finely executed, and the engine a credit to the shops of our city.

Imports of silver ore into Liverpool in August amounted to 213 tons and of silver lead ore 143 tons. The smelters are buying Caracoles ore at a reduction of about 10 per cent on rates previously paid by them.

CORRESPONDENCE.

The Proposed Bear River Tunnel.

EDITORS PRESS:—In the PRESS of August 30th you have an article on "Filling up and Cleaning Out of Modern Rivers, etc." The object of the writer of that article was to show the feasibility of driving a tunnel from the north fork of the American River through the dividing ridge (near Cape Horn, on the Central Pacific Railroad) to Bear River, and the great profits to be realized by working the tailings that have accumulated in the last named stream.

To construct a tunnel through 12,540 feet of solid rock is no small undertaking, and the enterprise should be carefully investigated before the work is commenced. The tunnel, it must be remembered, will be very near two and a half miles long, 12 feet wide and 9 feet deep, and will be run on 6-inch grade; that is, it will have a fall of 6 inches to every 12 feet; this is half an inch to the foot, so that 12,540 feet must give 522½ feet fall instead of 394 feet, as stated.

A flume is to be laid down in the tunnel its full width, and the same kind of structure will be laid down in Bear River. A flume in this grade will have a fall of 220 feet in a mile, allowing Bear River to have 70 feet fall to the mile, (which is probably liberal). The flume at the end of the first mile will be 150 feet above bed-rock, 90 feet above the tailings proposed to be washed, less the four feet that the tunnel *sets in below the bottom of Bear River*. The tailings are said to be on an average above Colfax 200 feet in width and 60 feet in depth; this will require over 21 miles of channel to contain the "50,000,000 cubic yards, worth $30,000,000." It is fair then to assume that in order to reach this vast body of tailings the proposed flume must be laid down in Bear River at least 10 miles, which would place the upper end 1,500 feet above bed-rock, and if the flume be placed at one-half the above grade, to wit: 3 inches to 12 feet, (a doubtful grade) it would be then 400 feet above bed-rock.

Now had Bear River ordinary sluice grade, the tailings would not have accumulated to the extent they have.

From what data do you estimate 400 tons of quicksilver deposited in Bear River, and thus a quarter portion of it is amalgam—800,000 pounds of amalgam with (say) $8 per ounce, or as we usually estimate it, at $100 per pound, would give $80,000,000, a very flattering prize indeed, but it must be remembered that "all is not gold that glitters."

Would it not be better for capitalists to embark in operations where one-fourth the proposed money to be expended in the Bear River Tunnel will open deep placer mines where the ground is sure to carry more gold than the tailings in any of the rivers. W.

Oakland, September 13th, 1873.

Notes of Travel in Utah.

[By our Traveling Correspondent.]

Bingham Mining District

Is situated in Salt Lake County, Utah Territory, and is bounded as follows: Commencing on the north, the 40th parallel west from Greenwich, running along the south end of Great Salt Lake forms the northern boundary of this district; 38 miles south of the above line, and near the foot of Utah Lake an imaginary line running east and west forms the south boundary; the eastern boundary is the Jordan river, and the western boundary is the watershed of the Oquirrh range of mountains, making the district about 38 miles long north and south by 20 miles wide east and west. This district first opened books for recording mining claims in 1863, and on the 17th day of September 1863, claim No. 1 was recorded, Geo. B. Ogilvie was the discoverer, and Mr. A. Gardner was the first Mining Recorder. Henry Thompson is the present Mining Recorder of this district.

Bingham Canon Town

Is in Bingham Cañon, about the center of the district, and distant from Salt Lake City 25 miles, in a southwest direction; and at an elevation of 5,700 feet. This district contains about 2,000 inhabitants, and the town of Bingham Cañon contains about 1,200 inhabitants. There are three hotels in this place, and if all are as good as the one at which we spent several days, then are the people blest. We stopped at "Griffin's Hotel," kept by R. S. Griffin. The "Dixon House" of this place claims to accommodate 100 persons first-class. Mr. R. D. Clark is proprietor. The Bingham House is presided over by O. E. Penwell Esq. The town has but one street and that follows the windings of the Cañon, and more closely resembles a California mining town than any I have visited in this Territory. The character of ores in this district is principally base or smelting ores, although there are, besides, free milling ores, copper mines, placer gravel mines, and deep channel diggings. The ores are lead, galena, silver, ruby and black sulphurets of silver, copper, gold, iron, also arsenic and antimony. The country rock is limestone, quartzite and granite, and there are at the present writing 2,528 claims recorded in this district.

The Principal Mines

Are the Jordan M. Co., Spanish Hill M. Co., Utah Co., Last Chance M. Co., Winnamuck S. M. Co. (Limited), Silver Hill M. Co., Neptuns S. M. Co., Kempton Mine, Northern Light S. M. Co., Vespasian S. M. Co., Bins Jacket Co., Bemis & Hiatt M. Co., Western Chief, New-Perces Chief Mins, Osceola and Lucky Boy, Royal Lode Mins, Bald Eagle Co., Nahoh Mins, Seaman Mins, Oregon Mins, Peahody Mins, Agnes Mine, Akey Mins, Moose Mine, Wall Street, Burton and Co's. Mine, Rainbow, Ten Forty, Clipper, Thrush, Yo-Semite Mins, Captain Jack, Klopenstein, Miller & Co's. Mine, Eagle Bird, French Spy, John Bull, Crœsus Mine and Orphan Boy. Each of the above named companies are shipping more or less ore, and altogether the above mentioned mines are producing and shipping an aggregate of 200 tons daily, the average value of which is about 25 ounces silver and 45 per cent. lead. Miners' wages here are $3.50 per day (currency), working eight-hour shifts; and about 450 are now here under wages.

To Get to Bingham Canon

There are two ways from Salt Lake City; one direct—all stage distance, 25 miles; fare, $2.50; the other is *via* the Utah S. R. R. to Sandy Station, and thence *via* Kelly & Benham's stage line. Rail, 12 miles; stage, 16 miles; fare, $2.50. The latter is the most comfortable way. The expense is the same by either route.

Spanish Hill M. Co.

This is an incorporation with a capital stock of $500,000, working under the corporate laws of the State of New York. Mr. E. Eichel is the Superintendent and Captain J. J. Stewart underground foreman. This company own five different locations, as follows: Spanish, Black Hawk, Queen, El Dorado and Buckeye; aggregating 3,000 feet of ledges, located in close proximity to each other, and situated about 2¼ miles southeast of Bingham Cañon town, in main Bingham Cañon. The main ore bodies of this company's mines run northeast and southwest, and dip to the southeast at an angle of about 25°. These locations are being developed by tunnels principally.

The Present Development

Is being done upon the Spanish and Black Hawk; their main tunnel is in 400 feet on the Spanish, connecting with the Queen shaft, tapping the ore body at a depth of 95 feet from the surface. Four different shafts have been sunk upon these locations, varying from 40 to 200 feet deep, and some 3,000 feet of crosscuts and tunnels have been run upon the same. They have about 300 tons of ore now upon their dumps that averages about 15 ounces in silver, 4-100 of an ounce in gold, and 50 per cent. in lead to the ton. This company are working 35 men regularly and extracting 50 tons of ore daily, which they are having reduced at their own

Smelting Works,

Which are located at Little Cottonwood Station, seven miles south of Salt Lake City, and distant from their mines 25 miles. This ore is transported (at present) on wagons to the furnace, at a cost of from five dollars to six dollars per ton. I neglected to state above, in speaking of this corporation's mines, that their ore bodies run from 10 to 25 feet wide, and in places neither side, top nor bottom is anything but ore. Their furnaces, two in number, are water jackets, and have a capacity combined of smelting, from 35 to 40 tons of ore. From two and a half to three tons of bullion.

Galena & Jordan Mines,

The above mines are owned by capitalists in Boston, principally, but some shares are owned in Salt Lake City, Messrs. Carson & Buzzo, attorneys of Salt Lake, are Managers of this Mine. Thos. H. Low is Supt., and Mr. A. Gauchat is principal foreman. These mines are located about 3 miles south of Bingham Cañon Town, and at an elevation of about 7,000 feet, or 1,200 feet higher than the Town of Bingham. The ore body of these mines runs nearly north and south varying about 17° eastward. This company's mines are nearly a mile in extent. The Jordan location contains 5,200 feet, and the Galena 2,200 feet. These two locations run in the vicinity of each other near the center. The development on these mines consists of an

Immense Open Cut,

Run upon the ore body, from the north end of their Galena location, for a distance of 150 feet, and they have stripped it for 700 feet farther; revealing an ore body from 20 to 35 feet wide, and averaging at least 25 feet, and at one point in their open cut, the ore body open shows a depth of 60 feet; prospects show it from 60 to 75 feet below that point. The country rock here is quartzite. The ledge matter is known to be 75 feet thick; how much more is not known. Suffice it to say that there is more ore in sight in this mine than any other in this Territory, and I don't know but anywhere on this coast, outside the Comstock lode of Nevada. From 75,000 to 100,000 tons are now in open view, that will average about $22 in silver, $5 in gold, and 50 per cent. lead. At this writing they have 250 tons of first-class ore on their dumps, and are shipping from 40 to 50 tons daily to their smelting works, located on the Jordan River, close to the Bingham Narrow Gauge R. R., and distant from their mine 17 miles.

Other Developments.

They have sunk numerous shafts, aggregating 600 feet in all, and run some 1200 feet of drifts and tunnels. They employ 35 men.

Thrush and Iron Mask Mines,

Located near the Winnemuck furnace, about one mile northeast of Bingham Cañon town. The above named locations contain 2,300 feet, and are owned by four equal partners, Hugh McKee, James Duncen, Andrew Brown and Patrick Powers; Mr. Brown, of San Francisco, is Superintendent. The ore body of this mine runs northeast and southwest, and dips to the southeast. The country rock is porphyry and quartzite, the latter forming the foot-wall, and the former the hanging wall; the ledge or ore body is about 7 feet thick. The development consists of 3 different tunnels run into the ore body; one tops the ore body at 20 feet in; the second strikes it at 50 feet, and the third tunnel finds the ledge in 60 feet. The company have about 25 tons of ore of a high grade upon their dumps, that assays $111 in silver, $33 in gold and about 54 per cent. lead. Twelve men are regularly employed at this mine, working night and day. The narrow gauge railroad to Bingham (almost complete) runs within a few feet of this company's works. It is certainly the handiest mine to develop in the district.

The Winnemuck Furnace

Is located about ¾ of a mile north of Bingham Cañon town, owned by the Winnemuck Silver M. Co. (Limited) of London. The company own a mine by the same name adjoining their furnace at which they are at present working 50 men. They also own another location ¼ mile south of their smelting works, called the Dixon; working but few men, but extracting some ore. The smelting works of this company are run by steam, with engine of 30 horse power. These works contain two water jacket furnaces, with a capacity of reducing 20 tons each daily. At present they are reducing only about 30 tons daily; producing about 8 tons of bullion, the average of which runs about 150 ounces of silver and one ounce of gold to the ton of lead. Working regularly 30 men. From the Mormon capital, in my next.

L. P. Mc.

[To be continued.]

Comstock's Financial Transactions.

The Virginia, (Nev.) *Chronicle* tells this story: Comstock, the man that took all the prestige of the discovery that bears his name, sold out his interest here to Judge Walch, of Nevada, Cal., for $9,500. Comstock, about this time, made another important transaction. He had lots of money, horses and lands, and he set out to find a loving companion to share his worldly goods with him. A Mr. Carter, living near Comstock's camp, was poor, but he was possessed of a young wife, and upon the ground that a fair exchange was no robbery, they made a trade; Comstock gave a horse valued at $225 and $75 in money, making $300, for the wife, and to make the matter still more binding, Comstock gave Carter a bill of sale of the horse and Carter gave Comstock a similar document, with the usual guarantee, that the animal was sound, kind and true, and warranted not to kick in the harness. But the novelty of a transaction so revolting to a woman of any spirit soon wore away, and Comstock's wife and money left him about the same time. Soon after she left him, Comstock told the writer that he could compel her to live with him if he chose, and in proof produced his bill of sale. People who know nothing of the early history of this country and its prospectors, and the fame that went abroad concerning them, cannot realize how such a man as Comstock, half crazy or half idiot, should ever have gained so much notoriety, while the real discoverers of silver in Nevada are forgotten. Few of the early discoverers and locators that were here in 1859 are worth anything to day, and I cannot now call to mind one individual that holds to any of the first-discovered claims of the famous Comstock lode. Such was Nevada in 1859, at that time forming the western part of Utah Territory, when the initiatory step was taken to form a separate Territory, with Governor Roop, of Honey Lake, as its first executive. What a lesson the recollections of those times have taught, not only financially, but morally! We can trace the many murders committed here to one great cause—that giant of all evils that looms up higher than Mount Davidson and broader than the plains looking to the eastward from this city—and its name is INTEMPERANCE!

The Largest Steam Engine in the World.

Pittsburg claims to have in progress of construction a pair of engines which will be the most powerful in the world. Reducing the capacity of some of the largest pumping engines to a uniform lift of 100 feet in twenty-four hours, it is found that the one at the Lehigh zinc mines will lift 3,456,000,000 gallons; the pair at the Chicago water-works, 4,500,000,000 gallons; the pair at Haarlem, Holland, 10,000,000,000 gallons; while the new Pittsburg engines will lift 14,240,000,000 gallons. The pair will weigh 1,500 tons, and will cost $423,550. The following dimensions will serve to give some idea of the magnitude: Cranks, 9 tons; shaft, 24 tons; four sections of the two valve chambers 120 tons; fly-wheel, 70 tons. The four plungers will weigh upwards of 400 tons. Cylinder, 64 inches diameter; stroke, 14 feet. Plungers, 40 inches diameter; 11 feet stroke. This ponderous piece of machinery will be used to raise water into Highland avenue reservoir, in Pittsburgh, a hight of 356 feet. It is estimated it will raise 70,000,000 pounds of water for each hundred pounds of coal consumed, the cost being at the rate of one cent for every 3,070 gallons.

The Cornucopia Mines.

Captain C. C. Warner, who a day or two since arrived in this city from this new mining district, gives us some particulars in regard to mines and country.

A Town Without a Name.

A town has been laid out near the mines, but at the time the Captain left it had not been named. The inhabitants are probably waiting to see if it shall prove worthy of a name. It is a strange town, for, although it has a large number of inhabitants, it contains no houses. The people live in tents and brush shanties. Ere this, however, there are probably two or three habitations made of planks, as lumber was arriving. The site selected for the town is said to be a very pleasant one. There are in all about four hundred persons in the district. As yet there is no money there except the little in the pockets of prospectors.

The Mines

Look well on the surface and prospect well, which is about all that can be said of them, as no man can see into the ground. Captain Warner brought in specimens from the Leopard, Chloride, Black Diamond and one or two other leads. All these specimens appear to be rich in silver. They are mostly sulphuret and chloride ores, but one specimen shows streaks of bromide. The ledges do not appear to be very large. The Leopard is about three feet in width, and the chloride at the depth of fourteen feet, is about six feet in width. The shaft on the Chloride lead is probably the deepest in the district. The leads are in most places "blind." When they do crop out, they seldom rise much above the rank grass growing on the hills. There is a sort of family resemblance in the ores from all the leads in the district. In their present undeveloped condition, no one can give a decided opinion for or against the mines. They look well as far as they have been opened, but whether they will increase in size and richness as they are followed down, or whether they will pinch out and disappear, remains to be seen. There is much prospecting, and a large number of lands have been located, but as yet few know much about the value of their claims.

The Country

About the mines is well watered by clear and sparkling brooks, and there is almost everywhere a rank growth of excellent grass for hay and pasturage. In the immediate vicinity of the mines timber, even for fuel, is not to be had. The nearest timber land is distant about fifteen miles from the town and mines. Even this does not amount to much as timber, but there may be had sufficient fuel to last the camp several years.

Game and Fish

Are abundant. Beautiful brook trout may be caught in nearly all the streams in the neighborhood, and in the headwaters of the Owyhee River are to be caught salmon of considerable size, which come all the way up the Columbia River. Grouse, sage hens and prairie chickens are plentiful, as also are rabbits of all kinds. The prairie chickens, however, are the great game bird of the region. These birds seem to be steadily advancing westward. Captain Warner, who scented all through this country during the Indian war times of early days, and who has been back and forth through the country almost yearly ever since, is satisfied that they have moved a great distance to the West since he first met with them. It is a question whether they advanced from the great prairies of the West of their own accord or whether they were "planted" where they are now found. Captain Warner says there is a story current that many years ago some man took the pains to bring a lot from the prairies of the West and turn them loose in the region where they are now found. He does not much credit the story, but still is a good deal puzzled to know how they got across the Laramie Plains. They have very strong wings, and when they take the notion can very easily pass over from three to five miles of ground at a single flight, as all Western men very well know. From what is said of game and fish, it will be seen that Cornucopia is not a bad place in which to spend a few weeks, whether or not the mines prove valuable. We presume our Virginia prospectors will have some wonderful stories to tell upon their return of their hunting and fishing exploits.—*Virginia Enterprise, August* 30.

THE highest mountain on the North American continent is Mount St. Elias, in Alaska, whose elevation is 17,900 feet. Next to it comes the volcano of Popocatapetl, in Mexico, 17,884 feet, and Orizaba, also in Mexico, 17,373 feet. If the newly-discovered peak of the Holy Cross, in the Yellowstone region, found by the Hayden exploring party, be really 17,000 feet high as they estimate, it will be the fourth peak in elevation on the continent of North America, and the highest mountain in the United States, excluding Alaska. Heretofore the highest peak in this country was supposed to be Big Horn mountain, which is elevated 15,000 feet.

JAPAN has a population of more than 30,000,000 souls, and a history which runs back, by tradition, over 2,500 years, with authentic record for more than 1,100; while her neighbors in China, from whom Japan obtained her written language, and whose civilization Japan adopted about a thousand years ago, have a population of nearly 400,000,000, and a history covering 4,000 years.

SCIENTIFIC PROGRESS.

The Nature of Sunlight.

Dr. Draper, of New York, has lately published a summary of the views respecting the activity of the rays of the sun that have long been held by him. According to Dr. Draper, the calorific, luminous and chemical effects produced by the solar rays are not so many distinct forces or emanations coexisting in a beam of light, and that can be dispersed by a prism, according to a fixed law, over the length of the spectrum, but are, on the contrary only the various effects of one and the same force acting under different substances. He maintains (1) that the chemical action is not limited to the more refrangible rays, but is equally distributed over the luminous and calorific portions of the spectrum; (2) that the ray effective in producing chemical or molecular changes in any special substance is determined by the absorptive power of that substance: (3) that there is also no special localization of the visual or the thermal effects. In the case of the silver iodide so generally used by photographers, Draper shows that the more refrangible rays produce an effect contrary to that produced by the less refrangible. In the case of the bitumens and resins he shows that a properly prepared film of these is as sensitive to either the nitra red or the ultra violet rays as the silver iodide is to the latter rays only. In the highly important case of the development of the carbonic acid gas found in the atmosphere by the action of sunlight on plants, he shows that this is accomplished by the action of the rays between the orange and the green bands of the spectrum, the maximum effect being in the yellow. The vegetable colors and the colors of flowers are shown to be dependent each upon the chemical action of a corresponding specific ray or rays. The union of chlorine and hydrogen goes on under the influence of every ray of the spectrum, but with greatest rapidity in the violet. The effects of light on chlorophyl show that the vegetable colors are destroyed by rays complementary to those that have produced them. The second of the above propositions is supported by the observations on the decomposition of the silver iodide, in relation to which Dr. Draper develops a fact of much interest to photographers, i. e., that the ordinary collodion film absorbs only about one-fourth of the whole actinic effect of the rays falling upon it; the rest passes through and is lost. Could the film be made to absorb the whole, its sensitiveness would be correspondingly increased. The second proposition is especially supported by the direct experiments with chlorine and hydrogen. The solar rays having passed through a layer of chlorine are unable to cause the combination of a mixture of hydrogen and chlorine on which they are allowed to fall; without the intercepting layer of chlorine the solar rays cause the immediate combination of the two gases. Further experiments with absorbing media show that the more refrangible rays are the ones effective in causing the union of chlorine and hydrogen, and that, furthermore, the rays that are specially effective are those corresponding to the bands common to the spectra of the two gases. The process of union begins after the lapse of a certain time, during which the rays entering the mixture have been acting upon it to prepare it for the subsequent union. The actual union is a progressive phenomenon, the rapidity of which increases with the intensity and quantity of light. The action of light on the chlorine compounds of silver is precisely similar to that on the compounds with hydrogen, and "there is to practical photographers an advantage, both as respects time and correctness, in light and shade gained by submitting a sensitive surface to a brief exposure in a dim light, so as to pass it through its preliminary stage."

These views of Dr. Draper are interesting from the fact they are in many particulars new, and different from previously received theories. The statement that the chemical action of sunlight is *equally* disturbed over the whole spectrum, will certainly occasion some argument. The theory maintained by Tyndall and other scientists in regard to the relative distribution of the heat, chemical and visual rays, is in direct opposition to the views here advanced.

FREE ANALYSES.—The Paris School of Mines receives and analyses without charge mineral specimens of all kinds, from soils to metal works of art. In five years, from 1868 to 1872, the number of such analyses was 2,916, or an average of 583 each year. A Government can undertake a work like this but it is almost beyond the powers of a school maintained by receipts from private sources. The New York School of Mines had a similar practice when it began its existence, and many hundred specimens were received for gratuitous analysis. But in this country the 583 analyses made each year by the Paris School would represent a gift of not less than 20,000 to 30,000 dollars. The specimens received in New York were to a great extent totally uninteresting, and probably many of them were drawn from old collections and represented stones which some ignorant person had just enough curiosity about to secure an analysis of, when he could get it free. The attempt had to be given up, but it is one that we would like to see revived if it can be done under conditions that will secure really valuable results, and not suffer the work to become too onerous to the schools which undertake it.—*Engineering and Mining Journal.*

New Great Premiums for Discoverers and Inventors.

Considering the fact that by the progressive wants of civilization the time must come when there will be no more coal or other fuel to spare to feed our steam engine, and also a great scarcity of nitrogenized matter to manufacture artificial fertilizers which agriculture can not dispense with, and considering that perhaps our grandchildren may already see such calamity that will arrest everything on earth if inventive genius does not come to our help, the Count de Donhet made, before the session of the French National Assembly, on July 22d, 1873, the following proposition:

Two national premiums are decreed, one of 1,000,000 francs, and the second of 1,500,000, (respectively about $200,000 and $300,000.) The premium of 1,000,000 francs to be awarded to the inventor of one or more chemical nitrogenized products made directly and economically from the nitrogen of the atmosphere, being either cyanides, nitrates, or ammoniacal salts, so as to obtain an inexhaustible basis for nitrogenized fertilizers, independent of animal matter, and also realizing an economy of at least ten per cent. over the artificial fertilizers of the present day. Two hundred thousand francs will be given to compensate the labor of the inventor who succeeds in utilizing the natural phosphates called apatites, and abundantly found in geological deposits, for fertilizing purposes, either in mixing them with the nitrogenized products of the trade, or otherwise, so as to obtain a substitute for the guano imported from across the ocean, being also ten per cent. cheaper than the same.

A million and a half of francs will be given to the inventor of the application of any motive power, dynamic electricity or whatever new motor, which may by expansion, circulation, or any other motion of fluid bodies, be adapted to mechanical and industrial progress, locomotion, or traction on rails or ordinary roads. The use of steam pressure and explosive gases are excluded, and the premium will not be allowed if the system does not unite with the impossibility of explosion or conflagration a saving of some twenty-two per cent. over the present motors.

It is expected that the proposition will be accepted unanimously. The inventions required are very difficult, therefore the danger of having to pay the premiums is not very great; but even if the problems were solved and the premiums had to be paid, it is considered in France to be a very desirable investment, as it would double the fortunes of the country and enrich the whole human race generally, so much so as to reduce a few million francs to such a comparative trifle that a country possessing the inexhaustible resources of France, can easily afford to compensate the inventor with due liberality.—*Manufacturer and Builder.*

Polar Regions.

The information developed by the investigation in connection with the loss of the Polaris, abounds with facts of much scientific interest. In the first place the cold was not so extreme as had been anticipated. In the next place the Polar regions are by no means devoid of vegetable or animal life. Among the contributions of the Polaris are skins and skeletons of musk oxen, bears and other wild animals; different species of birds and their eggs; numerous marine invertebrates; plants, both recent and fossil; minerals, etc.

Not the least interesting were the specimens of drift-wood, picked up in Polaris Bay, among which were recognized walnut, ash and pine. The dip of the needle amounted to 45 degrees; its deviation to 96 degrees. Auroras were frequent, but by no means brilliant. The rise and fall of the tides were about 5¼ feet. The greatest depth of water about 100 fathoms. The coldest weather was 58 degrees below zero. The prevailing winds were from the northeast, with occasional tempests from the southwest. Rain was occasionally observed.

During the summer the extent of both lowlands and elevations was bare of snow and ice, excepting patches here and there in the shade of the rocks. The soil during this period was covered with a more or less dense vegetation of moss, with which several Arctic plants were interspersed, some of them of considerable beauty, but entirely without scent, and many small willows, scarcely reaching the dignity of shrubs.

The rocks noticed were of a schistous or slate nature, and in some instances contained fossil plants, specimens of which were collected. Wolves, bears, foxes, musk oxen and other animals were repeatedly observed. Geese, ducks and other water fowls, including plover and other wading birds, abounded during the summer. Land birds were comparatively few; among these were the pelican and snow partridge. The waters abounded in shrimps, jelly fish and marine invertebrates. It is said that seals depend upon the former for subsistence.—*Odd Fellow.*

We may add that in all probability the results of the cruise of the unfortunate Polaris will not be lost, as it is supposed that all papers were carefully "cached" when the vessel was abandoned.

MECHANICAL PROGRESS.

Crystallization of Wrought Iron.

It has been a question long in dispute, says the *Mining Journal*—conceded by one authority, and denied by another—that the continued wear on iron, (as in the use of rails), caused a crystallization of the atoms composing the metal, which would sooner or later make the iron brittle and rotten. That is, the lamination, would so separate the atoms as to disturb their adhesion, or affinity, and thus destroy the strength of the iron. But it is more than likely that this hypothesis will never be proven to be a fact. Actual wear and tear upon iron will separate the fibrin, and in case of rails, will "broom" it, but it does not appear that what is known as crystallization follows, else the rails would break off short within a given length of time, and we would have but little less than a crumbling mass for what is usually regarded as imperishable iron.

A writer in the *Artisan* agrees with us when he agrees as follows with another contributor to the *Artisan:* Practically there is no limit to the life of iron, and the crystallization notion is only a theory. It is the practice, and a good one, perhaps, to use car axles for passenger coaches from one to three years, and then transfer them to freight cars, where they generally run till the journals get heated and cut down too small. Even then they might be bushed, and used an indefinite length of time, or a sleeve might be put on at first, to be renewed when accidentally injured. The car axles which break usually have sharp shoulders where the journal is turned off to fit the wheel, and the fracture usually occurs there. The observations and experiences of thirty years warrant me in doubting the truth of the crystallization theory, in any respect. I know of both cast and wrought steamboat water-wheel shafts that are twenty years old, and as good as when first used. This is also the case with line shafting, sixteen or eighteen years in use, to my knowledge.

A Gas-Propelled Boat.

Mr. William A. Leggo, of Montreal, Canada, is the author of a novel method for propelling vessels, designed especially for canal boats, to overcome the difficulties of horse towage. He discards steam wheels, ropes and other common contrivances. All that Mr. Leggo uses is a large bent pipe which is attached to the stern of the vessel, the mouth of the pipe being placed under water, pointing stern-wise. The pipe rises to the deck, and at the upper end of the pipe is a gas light and valves that open inward for admission of hydrogen gas and atmospheric air. As soon as enough hydrogen and air have entered, to wit, two parts of hydrogen to one of oxygen, the mixture takes fire from the gas light, an explosion ensues, the valves are closed, and the great pressure produced finds vent at the mouth of the pipe, acting against the water and driving the boat ahead. The valves then open again, the gases flow in, a new explosion takes place, and so on. These explosions follow with as much rapidity as the motions of a steam engine piston, and thus the boat soon acquires a regular velocity. Whether the manufacture, cost, and storage of the gas, and the working of the gaseous motor, will equal the economies and conveniences of steam power, and its propelling appurtenances, remains for Mr. Leggo to ascertain by trial. — *Scientific American.*

It is well known that all alloys containing copper, even in minute proportions, are readily acted on by acids, which makes them dangerous when used for household utensils. M. Helouis has proposed an alloy, under the name of platinum bronze, which is entirely inoxydizable. It is a nickel alloy, prepared from nickle made thoroughly pure by various processes and maceration in concentrated nitric acid. The proportions employed are nickel 100, tin 10, and platinum 1—the two latter metals being added to the fused nickel in the proportion of 4 of tin to 1 of platinum, and the remaining 6 parts of tin added subsequently. For bells and sonorous articles, the proportions are slightly varied, viz: nickel 100, tin 20, silver 2, and platinum 1.

GOLD PEN POINTS.—Gold pens are dipped with iridium, making what are commonly called "diamond points." The iridium for this purpose is found in small grains in platinum, slightly alloyed with the latter metal. In this form it is exceedingly hard, and well adopted to the purpose of the gold pen maker. The gold for pens is alloyed with silver to about sixteen carats fineness, rolled into thin strips, from which the blanks are struck. The under side of the point is notched by a small circular saw to receive the iridium point, which is selected by the aid of a microscope. A flux of borax and n blow pipe secures it to its place, and the point is then ground on a copper wheel with emery.

Enamelled Iron.

M. Peligot has made a report to the Society for the Encouragement of Industry, on the enamelled wrought and cast iron work introduced by M. Paris about twenty-five years ago, and for which the Society have awarded him two medals. According to the report in question, the enamel used is a true transparent glass, which allows the color of the iron to show through, very tenacious, having the same power of dilatation as iron, and capable of resisting powerful acids. The ordinary white enamelled ware of Paris generally contains lead, and often in large proportions, and is liable to be attacked by very weak acids.

M. Paris' ware has been employed for many purposes; cast-iron vases for gardens, decorated in imitation of old Rouen ware, have been exposed to all weathers without suffering any injury; a chimney in enamelled plate-iron was set up at the Mazas prison in 1849; the doors of the gold-assay furnace in the laboratory of the Paris mint are of the same, and have borne the effect of nitrous vapors since 1850; in 1866 this enamelled iron was selected for street names and house number plates, in several districts of Paris, and the report states that while other manufacturers make enamelled ware of the same appearance as that of M. Paris, the latter has shown its superiority in resisting the effects of time.

Specimens of new applications lately introduced by M. Paris, were presented to the Society, and included chairs, tables and stools for gardens, enamelled on sheet-iron and mounted on castings; and stands for dishes, decanters, etc., made in imitation of ancient earthenware, but presenting the superior advantage of bearing heat well.

THE POWER OF NITRO-GLYCERINE.—Dynamite, ignited by a violent percussion, such as is occasioned by the detonation of a strong fulminating cap, gives an explosion even in the open air, and, if confined, produces such an effect that one pound of nitro-glycerine corresponds to at least ten pounds of ordinary gunpowder.

Ignited without percussion, and by any other means, it merely burns in the open air, but if confined may give an explosion. Yet this explosion, whatever may be the temperature and the pressure to which the substance is subjected, is of an entirely different nature from that produced by percussion. In place of an explosion of the first order, or that caused by percussion, it is an explosion of the second order, of which the effect is such that one pound of nitro-glycerine is equal to about two pounds of gunpowder.

From this we conclude that dynamite accidentally ignited, as, for example, in the midst of a conflagration, would not explode unless confined.

Second, it may give an explosion of the second order analogous to that of powder. Third, the maximum intensity of this explosion, that is the greatest tension that can be produced when the package or magazine in which it is confined is of great strength, will be such that one pound of nitro-glycerine represents two of powder.

Dynamite then may, according to circumstances, produce explosions of an entirely different character. Percussion alone will produce an explosion of the first order. The presence and temperature to which the substance is subjected does not change the conditions of the phenomenon.

RAILWAY SPEED. — The London *Engineer* states that the highest railway speeds in the world are attained in England, and that the highest of all is reached on the Great Western railroad—the speed on the latter being given roundly as fifty miles an hour. Instances are given, however, of sixty-five and seventy miles an hour, and the *Engineer* believes that it would be possible to lay permanent way so well, and to maintain it in such excellent order, that trains might travel on it with perfect safety at one hundred miles an hour—indeed, miles upon miles of such track are now to be found on most of the great main lines, but nowhere can one hundred consecutive miles of permanent way in perfection be found; and, as a chain is no stronger than its weakest link, so a few hundred yards of bad track would spoil for the purpose of traveling at one hundred miles an hour a whole line. The really important question, argues the *Engineer*, is, given the line and the cars fit for it, what shall the engine be like, and is it possible to construct an engine at all which, with a moderately heavy train, will attain and maintain a velocity of one hundred miles an hour, on a line with no grade heavier than, say 1 in 300. After a thorough examination of the question, in all its bearings, the *Engineer's* figures prove that it is absolutely impossible to obtain a speed of one hundred miles an hour on a railway, if the resistance is anything like 120 pounds per ton.

A GREAT ENGINEERING FEAT ACCOMPLISHED IN ST. LOUIS, MISSOURI.—The two center sections of the arch between the western abutment and the first of the bridge, each consisting of an upper and lower rib, were completed, September 18th, by the insertion of the key or center tubes, and that portion of the arch is now finished, demonstrating the feasibility of the original plans, and its success is regarded as one of the greatest triumphs of engineering skill the world has ever seen. The two remaining ribs of this arch, which are only partially constructed, will be finished at once with ease. The three grand arches of the bridge were expected to be finished by the middle of December.

Weekly Variations in Stocks.

Based on Regular Sales of all Stocks in the San Francisco Stock and Exchange Board.]

A PROPHECY FULFILLED.—In view of the late startliug crasb in the New York money market, we would call attention to a remarkable letter from our New York correspondent, published by us April 19tb, in whicb tbe present situation is accurately predicted. It eems that even at so early a date the market was not without premonitions of coming evil, and our correspondent was right in tben emphatically declaring that the country "was on the verge of great financial tronble."

GRASS VALLEY is in a very prosperous condition and more miners will be put to work, as some of the old mines are being prepared for resumption of work and several other mines will soon be eending rich quartz to the mill.

LEAD was quoted in Liverpool in tbe 1st inst., at £22. 10s. to £23. 5s. for good ordinary brands. James Lewis & Sons' report states that should the trouble in Spain continue the value is likely to advance.

Our Weekly Stock Review.

THURSDAY EVE., Sept. 25, 1873.

The Stock Market this week has been very quiet, and no operatione of great extent bave eccurred. The absence of any new developmente in Ophir, the New York financial trouble and the Jewish New Year — all prevented any great activity. The news of the Yellow Jacket fire, which did no great damage, had little effect on tbe market. Those who came on the market to buy at low prices, because of the financial depressions and troublee in New York, made a mistake in their calculations. They bad little effect on onr Stock Market here, wbich has been already sufficiently depressed for some time past. A smell business, however, has been done in stock8 during the week, more on account of the absence of Jewish operatore from the market than anything else.

An important legal decision was made thie week in the case of B. F. Sberwood *vs.* the Meedow Valley Mining Company, which affects not only brokers, but the general public. The Court held that a certificate of stock is not a negotiable instrnment and gave judgment for the Company. This constrnction of the law will severely interfere with the operations of the Stock Board by making stock operatione insecnre. The case in substance was as follows: B. F. Sherwood, in tbe ordinary manner, became the owner of a certificate of Meadow Valley stock, but which had been lost or stolen from the owner, Mr. Levy, for whom it was purchased by H. Schmiedell, it stood in his name on the books of the Company, and was not transferred. Levy and Schmiedel proved the loss of the certificate to the satisfaction of the Company, and a new certificate was issued to the latter as trustee, the same as before. When Mr. Sherwood became the owner of the last certificate, he applied to bave it transferred to him, and was refused on the ground that the certificate had been lost or stolen. It was determined to test the case in tbe Courts, and Mr. Sherwood commenced suit to compel the Meadow Valley Company to recognize his claim. It was admitted that previous to tbe purchase by the plaintiff of the certificate that he had no notice that Levy ever claimed to be the owner of tbe stock. It was also admitted that when snch certificatee of stock are drawn in favor of a well known and responsible trustee, it has been for ten years or more tbe practice of brokers, and is the usual practice in this market, to sell and deliver such certificates of stock eo drawn and endorsed, by the mere delivery thereof from hand to hand, without any transfer or other entry made on the books of the Company, unless on account of payment of dividende, election of officers, or for some other reason tbe holder wishes a transfer and a new certificate, and snch certificatee are so delivered from one to another, on sales of the stock, without making iuquiry at tbe office of the Company or elsewhere as to want of title in tbe seller or other defect in the stock sold.

The plaintiff contended that a party purchasing a certificate in good faith acqnired the title, although the same was lost or stolen, because of the custom of stock brokers of negotiating certificates of stock standing in the names of responsible trustees without any transfer or entry on the books of the company, or without making any inquiries as to tbe want of title in the seller. In deciding the case Judge Morrison said it turned upon the question whether or not a certificate of stock is negotiable in a commercial sense. If it ie, the purchaser takes the certificato irrespective of the manner in which the same psssed out of the bands of the real owner. But if it is not negotiable, another rnle applies, whicb is, that the purchaeer gets no better title tban his vendor had, and no one can transfer to another a better title than be hae himself. The legal title being in Schmiedell, and the equitable one in Levy, and both having secured a new certificate for tbe lost stock from tbe company, the Court could see no reason why the compsny sbould not be protected against the plaintiff's claim through the old certificate. Schmiedell was in comtemplation of law the owner of the stock and had a right to transfer it to Levy, and if the plaintiff wae injured in so doing it must be ascribed to thie fact. The Court adverted to the stresslaid upon the custom of the brokers in disposing of stock certificates, which, however nniform and long continued, cannot, bowever, chauge or effect the positive provision of tbe statute wbicb provides that no transfer shall be valid except between tbe parties thereto, nntil the same shall have been entered on tbe books of the company.

Mining Secretaries will now have much more work to do than drawing salaries and making np reports, and doubtless will be compelled to keep a heavier force of clerke. This being tbe case, increase of salaries in thie department of mining operations may be looked for.

CAPTAIN J. G. KELLY left Virginia City on tbe 15tb to go to the city of Mexico, nnder contract to build tbree of McGlew's Patent Cbloridizing Furnaces near that place. We gave an illnstration of this furnace in our issue of August 2d of this year.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

SILVER MOUNTAIN.—Alpine *Miner:* Mr. Chalmers is working ore from the Silver Mountain Mines, and is doing so well as to be entirely satisfied. The Pennsylvania is looking splendidly. We sincerely congratulate our Silver Mountain friends on the present cheering prospects.

THE SCHENECTADY MILL is again in operation. Mr. Hunter is making another run, using some of the rubbish ore from the upper dump, which has heretofore been pronounced unfit for working with present appliances. Mr. Hunter's former experiments with low grade ores have convinced him that a fair per centage of the precious metals can be saved by his process of wet, or raw crushing, and that the balance can be concentrated so as to materially lessen the expense of cloriuation by furnace. Mr. H. is entitled to great credit for his persevering efforts in this direction. He has already solved some problems in the working of ore, and is bound to settle others.

SILVER GLANCE.—In this mine the face of the west drift in the lower or main tunnel continues to show seams and crevices filled with sulphurets. On Thursday the miners struck a large vein of water, which continues to flow a steady stream. In a few days the new hoisting works will be in operation, when the downward movement from the bottom of the 100-foot shaft will be resumed. The last installment of machinery pertaining to the new steam hoisting works of the Silver Glance mine, arrived on Friday. It consisted of steam pump for shaft, steam pipe, couplings and other fixtures. Men are already engaged in putting the pump and pipe in position, and in a few days the whistle of the new boiler will call the laborers on the M. & N. Co.'s works from labor to refreshment and back again to labor. Everything about the Silver Glance works is assuming a lively and business-like appearance. Important surface improvements have been made already, and others are in contemplation.

AMADOR COUNTY.

A RICH STRIKE.—Sutter Creek *Independent* September 18: A few days since the workmen on the 600-ft. level in the Mahoney Quartz mine found a very rich lead of ora about 7 ft. thick. It lies on the west of what is known as the main ledge and the richest part of the ribbon rock is next to the hanging wall and is exceedingly clear and firm. Free gold can be seen all through the rock with the eye. Next to the foot wall a very heavy body of fine sulphrets is found, and altogether no discovery has yet been made that gives such flattering prospects as this one in the Mahoney.

TWO WEEKS RUN.—The consolidated Amador Mining Company after a run of two weeks cleaned up about $16,000 In this clean up only the plates were disturbed, and the mill did not stop five hours. The rock now being crushed is improving in richness and at the next regular monthly cleaning they expect to increase their figures several thousand dollars.

THE HOOPER.—Nothing but the best of reports comes from our mining interests. The Hooper is working a full force and is taking out large quantities of the precious metal. Several quartz mines are being opened hereabouts, and it is expected that by Fall several will be running.

OUR QUARTZ MINES.—Amador *Ledger*, Sept. 19: Reports from various parts of the county are very favorable in regard to our quartz interests. Developed mines are yielding very flattering returns, and indications and new developments are valuable to a long run of prosperity. The Kennedy mine, near Jackson, never presented a more favorable appearance than at present. The new ledge, recently discovered at a perpendicular depth of 400 ft., is daily proving to be of great value, the ledge being from 10 to 12 ft. in width, the rock well filled with free gold and rich sulphurets, and will yield $35 per ton by ordinary mill process. The work done since the discovery proves the recently developed ledge to be the main one of the mine, heretofore unknown to the owners. Evidently the new vein will reach to the surface, a distance of 800 ft. from the depth at which it was struck, following the incline peculiar to other vains of this mine. This alone will afford rock sufficient to keep the mill running for years to come. From all appearances, this discovery in the Kennedy is likely to prove the most valuable ever made in the county.

THE ONEIDA.—We are pleased to note the fact that a large vein of very valuable ore has been recently struck in the Oneida, permanent in appearance, and which will add largely to the gold yield of this valuable mine.

BUTTE COUNTY.

The Marysville *Appeal* of Thursday, has the following item: "Some time ago a cinnabar mine was discovered in the hills west of Colusa, not far distant from Wilbur's Sulphur Springs. The ore was tested by the company organized to work it, and it has been found to be rich. Two iron retorts were ordered made at the Empire Foundry in this city, about three months ago, and cinnabar was reduced, and the value of the mine by the result was further confirmed. The works are in charge of Superintendent Caswell, and on Tuesday he ordered two additional retorts, which are to be finished up with the necessary casings as speedily as possible. The company have a rich and extensive quicksilver mine, though they proceed economically by making the mine develop itself, as all expenses of working and for additional machinery are paid for by the products of the two retorts in operation. In a few years an extensive and very profitable quicksilver mine will be in operation on the site of these experimental works.

ITEMS.—The new quartz mill for the Gold Tunnel mine near Grass Valley has been completed. It is to be run by water-power, and will not commence operations until the rainy season sets in; meanwhile rock from the mine is accumulating on the dumps.

The Grass Valley *Union* states that a company of miners under the name of the White Oak Company, have been engaged for some time past in working a ledge in the vicinity of Allison Ranch, supposed to be an extension of the North Star mine. They have sunk a shaft 150 feet on the ledge, the rock taken from which has paid, we are informed, nearly $100 per load.

Lockwood & Co. have located a first extension of the North Star ledge. The quartz taken from the new shaft of the North Star mine is said to be very rich, and the locators have a prospect ahead of a very good paying claim.

CALAVERAS COUNTY.

COAL.—Calaveras *Chronicle*, Sep. 20: We have lately received samples of lignite from the Lancha Plana coal fields that compare well with the best productions of the Diablo mines. The coal sent us recently is of a much better quality than the first samples we received, the result reached by arriving at a greater depth upon the stratum. We are not informed how far below the surface the incline has been driven, but labor is being incessantly prosecuted. There is no longer a doubt but that the Lancha Plana fields will prove permanent and valuable. Prospecting enough has already been done to prove that coal exists there in inexhaustible quantities and of a better quality than is found elsewhere on the coast. We hear that the Central Pacific Railroad Company is negotiating for the purchase of a portion of the fields with a view to extracting coal for use upon their various roads. Should they be successful in their negotiations development will follow that will give fresh impetus to every branch of producing industry in the section in which the fields are situated. As yet we have not had time to practically test the samples sent us, but will do so and give the result in our next issue.

CLEANING OUT THE DITCH.—We understand that a large force of Chinamen is employed cleaning out the Water Company's ditch, between its head and Campo Seco. The sediment from the hydraulics above has settled in the ditch to such an extent as to materially lessen its carrying capacity. As there is but a very small quantity of water at present, and nearly all the claims are laid over until the rains set in, advantage is being taken of the opportunity to put the ditch in good repair.

NEW QUARTZ MILL.—Mr. C. J. Garland, proprietor of the Good Hope quartz mine, at Mosquito Gulch, is building a new mill. The battery will contain eighteen stamps, and when completed will be one of the most substantial and effective pieces of machinery, of a similar character, in the county. The mill is to stand on the site of the old one, but everything except the engine will be entirely new. About 30 men are now employed in putting up the machinery, which will be in readiness for operations in a few days.

EL DORADO COUNTY.

PERSEVERANCE REWARDED.—About 2 years ago some parties commenced sinking a shaft a little to the east of what is generally known as the "Mother Ledge," on top of the hill south of Ollis' old blacksmith shop. At a depth of 50 feet they drifted south on the ledge and took out rock that milled $24 per ton. At a depth of 70 ft. the shaft had to be abandoned on account of bad air. About this time the claim fell into the hands of its present owners, Messrs Mitchell and Holloway, who, nothing daunted, commenced running a tunnel to strike the chimney, on which the shaft was sunk, at a depth of about 120 ft. They have run their tunnel in 260 ft., and have struck a splendid body of ora, showing free gold plentifully. The width of the ledge cannot yet be determined, as they have not yet worked through the ledge, although they have developed a little over 3 ft. of splendid ora. The "hanging" or east wall is slate, and as smooth and well defined as could be wished. The rock resembles that of the old Pacific. We congratulate Messrs Mitchell & Holloway on their present prospects, and hope soon to be able to give a still better report of their mine.

NEVADA COUNTY.

THE WYOMING MINE.—Nevada *Transcript*, Sept. 19: This mine, situated near by, which is owned by San Francisco parties, is being put in thorough working order by Mr. Purinton, Superintendent. The company have erected hoisting works, formerly used by the Mt. Auburn Company, on Ragan Flat. An incline about 500 feet is to be put down as soon as water can be brought to the hoisting works to raise steam. The prospects from the ledge of the Wyoming are very encouraging. At a depth of 80 ft. where they struck water, the ledge was three feet thick, and showed very rich in free gold and sulphureta. Several boxes of the rock were sent to San Francisco, and the owners being satisfied with the result made a contract with J. C. Abbott to move the hoisting works and place them in their present position, which he has done to the satisfaction of the company. A new mill is to be built in the spring, by which time, under the superintendence of Mr. Purinton, the incline will have been sunk, and a large force of men will be employed in taking out rock.

CANADA HILL.—We made an item a short time since, of a very promising ledge having been discovered on Canada Hill, by Mike Enright. Since that time thirty tons of rock have been taken out by two men, and a crushing is now being had at the Oriental mill, on Deer creek.

TUOLUMNE COUNTY.

GOLD AND SILVER ROCK.—Tuolumne *Independent*, Sept. 20: Billy Littlefield discovered, week before last, a vein of gold and silver above the upper reservoir. The croppings show a width of 10 inches, and in sinking upon it, is in appearance a roof-shaped formation—widening out at a depth of 2 ft. very extensively. An assay has been made of near $30 in silver and $20 in gold.

NEW LEAD DISCOVERED.—Capt. Doudle, formerly of American Camp, recently discovered a monster quartz vein measuring 40 ft. wide, near the New Ditch tunnel and south and middle fork of the Stanislaus. The character of the rock is of a greyish color and carries gold and sulphurets. Mr. Sevenig, of Columbis, made an assay of $25.50 to the ton. Capt. Doudle and Jersey Dunster have located the vein.

Nevada.

ELY DISTRICT.

CHIEF OF THE HILL.—Pioche *Record*, Sept. 21: The shaft has now reached the depth of 122 ft. below the 210-ft. level, a progress of 12 ft. having been made in the past week. When the shaft is 30 ft. deeper, or a total depth of 250 ft., it is the intention to cross-cut for the ledge, which, it is believed, will be reached inside of 100 ft. In sinking the last 50 ft., numerous little stringers or feeders of ore and ora-bearing quartz have been encountered, and everything goes to show the near proximity of a valuable ledge. Drifting continues on the 210. ft. level with first-rate prospects. Working 2 shifts throughout the mine.

PIOCHE.—The work in the mine is going on about as usual. There are now on the dump about 70 tons of ore. The ore in which the men are at present working is very good, much better than reported the previous week. Milling will be commenced again about the first of next month. Fair progress is being made in the new shaft, which yesterday attained a depth of 250 ft. The grading for the machinery on this shaft is nearly completed.

SPRING MOUNTAIN TUNNEL.—There is but little change to note since last week. Sinking continues as before, a very satisfactory progress being made, considering the hardness of the ground. The shaft in No. 3 has now reached a perpendicular depth of 100 ft. It is expected to cut No. 2 ledge with the shaft at a further depth of 50 ft. They believe they will find ore be dies in No. 2.

RAYMOND & ELY.—The full force (160 men) is at work. There is a large body of very good ore in the 8th level. The drift from the 9th level is expected to strike the ledge almost any hour. The rock there is extremely hard. It is daily expected also to strike the ledge in the east drift from the 8th level.

ALPS.—The drift on the 300-ft. level is now in 350 ft. Everything looks favorable. The face of the drift is in quartzite. The vein in the winze from the second level is 4 ft. wide. The ore in this vein assays from $75 to $80.

CHAPMAN.—Drifting is being continued with a decided improvement in the appearance of the drift. The ledge is wider, more compact and uniform, and better defined. The ore is better at the bottom of the drift than at the top.

HAVANA.—Everything about this mine continues to have a favorable appearance, as the work goes on. The owners have great and increasing expectations of success, and, we think with reason.

CARGLINE.—The last contract for 100 ft. was completed yesterday. The shaft is now 325 ft. deep, and a new contract for 100 ft. more has been let.

SILVER PEAK.—The ore which is being taken out of this mine is good as usual. The incline is still being sunk. The usual force of men is employed.

AMERICAN FLAG.—There is no change to note in this mine since our last report. The American Flag mill is now crushing ore from the Newark mine.

LOUISE.—A drift is being run east from the 200-foot level. It is now in a distance of 150 feet. There is no change to note.

PACIFIC TUNNEL.—Mr. Church, one of the trustees of the company, will arrive here this evening, and work will be resumed on Monday.

PEAVINE.—The shaft is now down about 100 feet. There are some $300 rock in sight.

STILL SINKING.—The workmen in the Bowery, Portland, Ivanhoe, Piocha and South Side continue to sink their respective shafts.

WASHOE DISTRICT.

YELLOW JACKET.—Gold Hill *News*, September 19: The connecting drift with the Imperial mine, at the 1,300 feet level was completed. Last night a fire broke out in a blacksmith shop, 300 feet north of the shaft, on the 1,300 foot level, which has entirely destroyed the shop, and is still burning in the winze from the 1,100 foot level. The fire has been reached and attacked from both the Imperial and Yellow Jacket sides, and is entirely confined to the winze, so that there is a strong prospect of its soon being subdued. Nothing new to report of the prospecting drifts on the different levels.

CONSOLIDATED VIRGINIA.—The main drift north on the 1,200 foot level, from the Gould & Curry shaft, is making excellent progress, the face in fine ore, which is extracted and deposited on the dump for milling, just as it is taken from the face of the drift without any assorting whatever. The face of the drift is intensely hot, but it is expected that it will make connection with the south drift of the same level from the shaft by the middle of the coming week, which will give a good circulation of pure air, and greatly facilitate the work of cross-cutting the ledge and developing the mine. The water is apparently all drained from this level, so that no further trouble need be looked for in that respect until the main shaft is sunk some distance below the present level. A strong force of men is busily employed in raising the third compartment of the shaft, which was delayed in sinking by reason of the haste to reach the level of the lower tunnel as soon as possible, and begin drifting to connect with the Gould & Curry shaft. All the pump bobs, pump stations and bob pits are now completed, ready to put in the entire pumping machinery as soon as the main upright wheel of the pumping engine shall arrive from San Francisco, where it is now being manufactured. When fully completed, the hoisting and pumping machinery of this mine will be second to none on the line of the Comstock, and we confidently expect that it will not be many months hence before we shall place the Consolidated Virginia on our list of dividend paying mines.

CROWN POINT.—Daily yield 350 tons of ora, which is taken from the 1,000, 1,200 and 1,300 foot levels. The various braasts and ore stopas on the different levels are both looking and yielding splendidly. The north winze from the 1,300 to the 1,400 foot levels is down 72 feet, the bottom in hard coarse quartz, which gives small assays. Sinking the middle winze is making good progress, the bottom being in ora of a good character. Heretofore, owing to the slowness of drawing of the water through the main drift at the 1,400 foot level, but one shift of men has been employed in this winze. The water being now drained, three shifts have been set to work, so that much better progress will be made. The main south drift on the 1,400 foot level is being rapidly driven toward the Belcher line. The main drift south on the 1,500 foot level is being rapidly pushed ahead, the rock in the face blasting and working well.

BELCHER.—Sinking the main inclina is making good progress, the bottom still continuing in hard blasting rock. The main east drift from the inclina at the 1,300-foot level is in 67 feet, the rock in the face blasting quite hard. The winze from the 1,200 to the 1,300-foot level continues in good ora. The winze from the 1,300 to the 1,400-foot level is making excellent progress, the bottom in a fine quality of ora. The main south drift on the 1,300-foot level is in a distance of 365 feet, the face still in good ore. The cross-cut east from this drift is also in good ore. All the ore brasts and stopes throughout the mine are holding out well and yielding splendidly.

CROWN POINT RAVINE.—The south drift from the main west drift is in 125 ft., the last 80 being run through hard blasting quartz with spots and bunches of fine ore. The north drift from the main west drift is in 50 ft., the face in clay, quartz and porphyry. Work in both of these drifts has been suspended for the present, on account of bad air. The main west drift is still pushed energetically ahead to tap the west ledge in which the rich prospects were found a few years ago. It is expected that this ledge will be reached in about 40 ft. more, when some good developments may be looked for.

GOULD AND CURRY.—Daily yield, 35 tons of ore, from the old upper workings. The prospecting cross-cuts east from the main south drift on the 1600-ft. level are still driven steadily ahead, the developments not showing quite so favorably as they were a week ago. The flow of water from all parts of the mine has greatly decreased during the week. The east cross-cuts from the main north drift on the 1500-ft. level are still driven ahead through hard blasting quartz, showing considerable quantities of low-grade ore.

CALEDONIA.—Daily yield, 75 tons of ora, keeping the Sapphire mill steadily running, and gradually accumulating a large surplus at the mill and on the dumps. The ore-breasts on the 500-ft. level are looking finely, and the prospects of the mine were never better than at the present time. Preparations are being made to enlarge the shaft, so as to give greater working capacity, and should necessity require, the company will put in heavier pumping machinery without any considerable delay.

SILVER HILL.—A fine body of ore has been encountered by the north drift at the first station, near the Justice mine. Daily yield, 60 tons of ore, keeping the Bacon mill steadily running. Preparations will be commenced in a very short time to resume sinking the main shaft, which was stopped by the heavy flow of water from the bottom.

WOODVILLE.—The face of the main north drift at the lower level is looking remarkably well, having cut through a body of ora which, from present appearances, will surpass in both quality and quantity anything yet found in the mine. Sinking the new shaft was commenced on Tuesday last, and is making excellent progress. New machinery of the most substantial and approved style has been ordered from San Francisco, and will arrive on the ground, ready to place in position in a very short time.

[Continued on Page 204.]

Our Sugar Trade.

Like that in Tens, the trade in Sugars is almost entirely a growth of the past century, and, from comparatively small beginnings, it has grown to a world-wide magnitnde. On the Pacific Coast we have for some time past made an effort to snpply ourselves with sugar, made from heets; and it has also been snggested that, with irrigation, our sonthern plains are fitted for the cane. But, virtnally, all onr sugars are imported, and have been since the formation of the State. The trade thns created is one of onr most important ones, and has grown with and in proportion to onr growth, and bids fair now to grow with accelerated pace. Coming to ns principally in the raw state, its refining forms one of our foremost industries, and will, if the efforts now making to compete with New York in the Mississippi Valley have any share of success, in a year or two completely eclipse all others. To this portion of the bnsiness we first direct our attention.

The Refineries

Of our city are at present four in uumbcr; the Bay, the California, the Golden Gate, and the San Francisco and Pacific. These refineries are hy far the most extensive and imposing mannfacturing establishments in the city, and have, exclnsive of machinery, cost hnndreds of thousands of dollars. They are gigantic piles which wonld do honor to any manufacturing city in the world. They employ, in the aggregate, hundreds of men, and form most continuonsly-hnsy hives of industry. Au inspection of their appointments and management gives the visitor a higher impress of our enterprise than almost anything else he may encounter outside of the railroad that pierces the Sierras aud the mines that penetrate the bowels of our mountains.

The Bay Refinery,

Which rises from the corner of Battery and Union streets,—the most conspicuous object in the city to the eyes of the passsenger by sea, as his ship approaches the water front,—was established in 1864, nine years ago, by the formation of a large stock company, who saw in the increasing demands of the market opening for tbeir enterprise. On starting, the capital was $250,000; hut six months ago, on acconnt of the greatly larger amonnt of busiuess done, they increased it to $500,000, thus doubling it, and, of coursc, doubling their power of production. Since starting they have introdnced a great deal of

New Machinery,

Of which the most important and iuteresting is that for making Cnhe Sngar according to what is known as the Partz Process, which supplies a desideratnm long felt in the mannfacture of Cnhe Sngars. By tbis process an article of Cube Sugar can be made, much snperior in quality to any heretofore offered, at a much reduced cost for the manipulation connected with the process; at a less cost for the machinery reqnired, and at a large economy of room, time, and fuel for drying. We have seen sngar made ready for shipment, by this process, in four hours from the time it left the vacuum pan. There is but a small amount of this brand of sngar obtainable as yet; hut a fnll supply for the San Francisco market will be furnished in a few weeks. Tbis sngar has not yet been placed upon the Eastern market, hut soon will be. The machinery by which it is produced is a California invention, recently patented by Prof. A. F. W. Partz, of Oakland. The refinery is nine stories in hight, and is 187 hy 125 feet. The several stories are occupied as follows: The first contains the offices, warehouses, pan room, engine room, etc.; the second is entirely devoted to packing; the third is occnpied by the new machinery, the centrifugals, etc.; the next fonr floors to granulating; and the last to melting. In the rear are the boiler and the charcoal kilns, which disconnected from the main bnilding, are in a separate one, 40 feet hy 75 and two stories in hight. Fifty men are constantly employed and there is made from 30,000 to 35,000 pounds of sngar per day. A considerable qnantity of this is exported to Mexico. The proprietors are P. Mayer and Brother, Herman Melse, Henry Voorman, Nicholas Van Bergen aud John Van Bergen.

The San Francisco and Pacific Refinery

Boasts a long and prosperous existence, heing first established in San Francisco in 1857, sixteen years ago. Subsequently, in 1862, the Pacific was establisbed, which amalgamated with the former in 1862, the establishment ever since remainiug nnderthe above name. After working prosperously till last year, new and extensive additions were put up sufficient to increase the capacity of the factory 40,000 pounds per day, and costing $60,000. It was under the superintendeuce of Mr. De Ro, Sr., since deceased, for a period of four years, and is now managed by Messrs. Frederick Roeding and G. Danzel, with Mr. De Ro, Jr., as Business Agent, B. Callaghau, Chief Engineer and Superintendent. When the refinery was first established, it refined only 15,000 pounds per day, whereas it now refines 120,000, an increase in sixteen years of a thousand per cent. —an increase which hears the most hrilliant testimony not only to the hnsiuess qualities of the past managers, but also to the continued progress of the city and State. For such institntions as this grow with their growth. The refinery is not only one of the most complete on the coast, hnt in the United States.

How to Build up the State.

Onr want is people—people to fill our broad valleys, to swarm on our thousand hills, to huild np cities and villages throughout our interior. Larger than Great Britain or Ireland, not mnch less in size than France or Germany, we have only one-fiftieth of the population of the former and less than one-sixtieth that of either of the latter. As large as New York, Pennsylvania and New England, we have but an eighteenth part of their population. And they are not yet conceded to be thoroughly developed. Immigrants are pouring into their seaports day hy day, helping to swell the ranks of their farming population in the country, and that of their manufacturing and commercial in the towns and cities. For want of this immigration we hava not been ahle to push ahead as we ought.

Our Zeal has Outrun our Means

All the while that wa were receiving tha crowds that flocked to the great gold fields of our State, we, or rather our State, flonrished like a young Bay tree, not indeed so much on account of the gold, as on account of the increased population hy it attracted thither. It is hy many doubted whether as a whole the miners of '49 and '50 did not spend a dollar for every one they obtained. But even if they did the land became redeemed from savagery and slavery; the hut of the Indian was replaced hy the villa of the merchant, the cottage of the mechanic and the tent of the miner; and the rude encampment, hy the cultivated and populous city. Fields were enclosed and tilled, palaces arose where huts had been, the solitude of the forest was broken by the axes of the pioneer, the placidity of the waters of the great hay by the fleets of nations, and tbe deep rivers of our valleys became the artery of a

Life-Giving Commerce.

Even if the twelva hundred million dollars worth of gold and silver taken from the earth in California, Nevada, Idaho and Montana, since 1848, cost the same amount of money in its extraction it has rendered available for the purposes of civilization a territory larger than the insular empire of Britain, tha continental ona of Germany, and the republics of France and Spain, and has laid

The Foundation of Nations

In the States and Territories that stretch from Fraser River to the hot deserts of Sonora, and from the blue waters of the Pacific, to the Staked Plains of Texas and the rolling prairies of Kansas, Iowa and Minnesota. Tha foundation has heen laid by the labors of tha pioneers, hy those of our predecessors, and it remains for us to finish tha superstructure. Lika St. Peter's, which slowly raised its head to heaven during three centuries, or like the giant temple of Cologne which bas crept on towards the empyrean during three centuries, tha work of building up an empira hy these western waves and snowy Sierras may be tha work not of years hut of centuries. We can at least build the first story of the mighty edifice, which it shall be reserved for our children nnborn to go on and perfect. But it is only hy a wise and liheral policy, ons which shall draw towards our shores tha superfluous population, the gallant, the hrava, the adventurous, and tha indnstrious of all nations, that wa may hopa to succeed. A great nation is, in its early centuries, like an exotic that must he carefully nurtured and tended until it has reached that stage when it can progress exclusively hy its own

Native Strength and Inherent Vigor.

Notwithstanding all the attractiveness of our land, we labor under some peculiar disadvantages. We are placed at an immense distance, eqnal to that of half the girth of the world with its expanse of continents and oceans, from the great seats, tha nurseries of Caucasian population, and the classes that we most desiro to draw thence would have to expend tba labor of years, before they could obtain the means of reaching the distant shores of tha Pacific. But placed in their way are other and attractive lands wbere thousands, millions of their kinsmen, have already found a home and riches. What wonder then if thay settle down hy the way, and only the scattered remnants, tha waifs and strays,

The Jetsam and Flotsam of Population.

So to speak, ever reacb California or its sister states and territories. This we must remedy or our growth will he slow, our political childhood long continued, and the time of reaching our national maturity postponad to a long distant period of the futura. The United States, of which we form one of the youngest members, if deprived of the healthy and invigorating influences of immigration, would he to-day a small and weak confederation of provinces, a mere strip on the shores of the Atlantic, with no more population and little more commercial vigor than that unhappy hordering republic of Mexico, which many amongst us believe fated at no distant period to perish from internal commotion, and to utterly disappear from amongst the family of nations.

This is evident from the rate of the increase of births over deaths. In 1850 this was 1.32 in every hundred, and at no period earlier thau this was it greater. This would only give to the United States in 1870, a popnlation of nine million six hundred thonsand whites and free colored in 1870, the result of an increasa of 1.32 per cent on the three million and a quarter white and free colored every year since. The halance then of nearly twenty-four millions has been added to the population hy immigration.

Immigrants and Their Children

Have surely huilt up the nation, made roads throngh the forest and the wild, built tha navies that going forth from our porta hava covered the seas, raised cities in the wilderness, and laid the iron road and tha telegraphic lina from sea to sea. The gold and silver brought to tha United States by the eight millions of immigrants who landed there from the year of independence to that of tha taking of the last census, from 1796 to 1870, equalled in amount tha volume of greenbacks now circulating throughout tha land, and at least was donhle tha qnantity of specie ever at any one time existing in the country. And the value of their labor for a year and a half equalled the value of all property not landed that the people of the nation hold at the present time. Were these immigrants and their descendants to he taken from the present population of tbe United States, and all the money that they hrought with them with its interest calculated at aven five per cent, the

Wealth and Power of the Nation

Would vanish like a dream of the night. But tbese immigrants to which the nation owes so much did not voluntarily cast their lot with it without great and surpassing indncements. They ware, freedom from tyranny, the most complete freedom on the earth; the hroad continent was made their heritage, their country, they might occupy it and rule it. The sama inducements ara yet offered hy these States of which we form a part, and tha immigrant has only left the land of his birth for a week before ha sets foot on the land of his adoption. And for the small sum of *fifteen dollars* he can he transported thither. In the same way or in much the sama way that the United States hava been built up

The Dominion of Canada

Is now building itself np. It bas long granted tracts of land on easy terms, and bas dispensed with very cumbersome and tronblesome forms of naturalization. The result is that though hundreds of thonsands not only of the immigranta thither, hut also of those to the manor horn find for themselves homes in the United States every decade, yet within twenty years the popnlation of the colonies composing it has almost donbled. And Canada for half the year is ice-hound—a vast realm of ice and snow, when all field industry is paralyzed and nature seems wrapped in an eternal winding sheet. Canada is however within as easy reach of Europe as are the United States, and tens of thousands go thither in preference, attracted by the ties of national kindred.

Far Away in the Ocean of the South

For the past qnarter of a century, a vast empire has been growing up in the sight of tha nations, or rather we should say, the foundations of one have been laid. The colonies of Australia and New Zealand are slowly but surely increasing in population. They have now attained one of two millions. In another decade it will nnmber three millions—and it has been built up by immigration—altbongh its attractions natural or proletarian are not a tithe of those of ours. Gold first drew its thousands thither, hut the stimulus thenca derived abating, the legislators of these lands have been wise enough to offer extra inducements to the millions of Europe to reach their shores. The Government of Victoria issues passage warrants to such of the inhabitants of the colony aa wish to send for their friends or acqnaintances, and on presentation of these warrants by the agents of ships the Treasury Department pays three-fourths of the amount of passage money. The other colonies have special agents in Great Britain and Ireland who secure immigrants for them—the agents securing a free passage and the government of the colony to which they are sent finding tbem employment on their arrival. In fact, the question of immigratton in these colonies has long been one of the great questions of the day, and parties have been defeated and have attained power and influence according to their views on it.

The efforts made by these ought to he a lesson to us. It is too much to assume that those whose labor is their capital will neglect Canada, Australia and the East, and come hither attracted by the very sound of the name of our State. The majority are not sufficiently well off. No one likes to arrive in a country empty handed, and after paying $400 to convey his family from Ireland, England, Germany, France or Italy, the ordinary emigrant would have nothing left, and might for aught he knew bave to faca starvation, a stranger in a strange land. Whereas, if ha went to Canada or tba States, ha would after expending say $50 for passaga have $350 left, on which to begin tha world, to look around him, and decida on his future plans. Going to Australia he would he as well placed. Even tha immigrant who starts from Europe for this State would if he came overland have most likely his mind unsettled, hy the prosperity of tha Western States, and tha abundance of good land to ha found in them, and so would never reach the Pacific Coast at all. It is necessary therefore that

Special Inducements

Shall ha offered to attract to our shores tha hundreds of thousands who would gladly flock hither, if they only knew how. What shall these inducements be? Aid to reach bers, or land to cultivate? One or hoth. We say both. This matter has already been disscussed in the local press, and the *Chronicle* has long since advocated the devoting of a sum of money either hy the State or from private sources, in order to assist thosa who wish from a distance to come hither. Looked at from tha first point of view the only consideration is whather tha devoting of a certain sum for immigration purposes would pay; whether tbe slight additiou to the taxation that might he necessary would be justified hy the results. For seventy dollars per adult, any number of people could ha transported hither, hy the ships returning after having discharged at Liverpool their cargoes of wheat. In fact their proprietors would he exceedingly glad to carry immigrants hers at that rate, a many of them otherwise ara obliged to return in hallast, earning nothing. Thesa ships would then

Carry Away Wheat and Bring Back People.

If a sum of fifty million dollars were devoted to it, it would carry to our shores in a few years over seven hundred thousand peopla, thus doubling our population. The immigrants would by the valna added to property, by the additional population thus settled down more than donble the wealth of the State, would add to it at least six hundred millions of dollars. If the Legislatnre when it had ceased to he the hattleground not for rival principles, hut for rivals in selfisbness directed its attention to the promotion of

The Solid Interests of the State,

It would take tbe matter up and provide for soma such schema by law. The money could be raised in State honds, the interest upon which at 5 per cent could be met by a rate of ½ of 1 per cent, upon the present value of property in the State, if deemed necessary. But both principal and interest could he met hy holding tha immigrant under honds to pay the money advanced. Paid in fiva years, the whola would not requira from him more than thirty-three and a third cents per week. This is taking the narrow and picayunish view of the matter. Tha donbling of the popnlation would also be the donbling in siza of all our towns and cities, it would be douhling our agricultural population, it would be douhling our merchants' profits, it would be douhling, possibly multiplying three-fold tha present assessed value of property in the State. Out of that principal and interest would it have nothing. The new population would hy tbeir taxation pay the wbole thing many times ovar themselves. In

The Interests of Commerce and Industry

Generally, as a policy, it would be a master stroke. The straggling tradesmen of our small interior towns would become flourishing merchants, and the latter in onr city would have good paying customers, and would all tho sooner reach the hight of their ambition, and acqnire independent fortunes. The employers of the new additions to our population would in one year make a profit ont of their labor at least three times as large as the sum that was expended in bringing them hither. In five years some one would hava made at least $1,250 out of each immigrant. Nay, accounting for the profits made hy tradesmen, that sum might be douhled, so that in reality the present inhahitants of the State would have made as profit out of the immigrants the

Enormous Sum

Of ona thousand four hundred millions of dollars, mora than enough to pay away one half of tha present national debt, and enough to give a capital of seven thousand dollars to every adnlt male at present in the State. The thought of this should itself be an indncement for every one, from the highest to tha lowest, to agitate the matter. And hringing it to a successful issue wa should also he helping to solve the dreaded Chinese question, and to import sufficient white people to make head against the threatened flooding of the State with Chinese. But knowing as well as we do the character of tha Legislature and of the henchmen of political parties, wa know full well that to axpect anything so liheral and enlightened would he utterly vain. If the thing is to be done at all it will have to be the resnlt of

Private Enterprise,

And as a private enterprise it would pay. It conld be done on any scale, and in fact it has been done this year on a small scale, in the introduction of a nnmber of English agricnltural laborers. But it should be dona on a larger. A company with 10,000 shares of $1,000 each, one-fifth paid up, would be sufficient to do it. They would introduce fifty thousand immigrants every year, and obtaining employment for the new arrivals, tha latter would be enahled to pay the amount of their passage money in one year. There is not a large land-owner in the State that could not make his fortuna by participating in this, and by acting wisely and liherally. By bestowing on our immigrants that wished to cultivate tha land, say every alternate section of his land—when divided up into lots—he would enhance tba value of the other half many times more than what that of the wbole would he in a dozen years. A liberal policy of this kind is the only way to build up the State,

Develop its Riches

And pave the way for its occupying a future proud position amongst tha nations of the earth. We want the farmers of Ireland and Great Britain to develop the cereal wealtb of our central and northern counties and those of our coast valleys, to grow wool, and to rear cattle; tha vine dressers of Champagne and of the banks of the cragged and castled Rhine, the mnlberry growers and silk-worn feeders from tha plains of Lombardy, the beet growers from Germany, the silk weavers from Lyons, the cotton-weavers from Manchester, St. Etienne, and Dnsseldorf, and the linen weavers from Belfast and tha north of Ireland. And see what

An Inexhaustible Source of Population

From whicb we have to draw, a source overflowing perennially and which supplies material for nation making at the rate of millions per annum. The annnal increase of the population of Europe is not less than three millions. At tbis rate it conld create every twelve months a new State with the population of Ohio, and retain its present population. It could build up the United States as it now stands in a little over thirteen years, and with beneficial results to itself. England for example has built up her great manufacturing trada in tha present century precisely as the United Statea advanced in population and consequent wealth. With the inexhaustible source of population, with onr equally inexhaustible riches, and with our fertila lands, we ought to be able to draw to us during the coming half century as great an immigration as the United States have during the past. But we must make the way easy—lessen the expense of reaching our shores, and disseminate in Europe information about them. To perform the first we must spend. But this money will return to us an hundred fold in increased national riches and in the opening up and developing of a thousand at present closed up channels of trade and commerce.

Furnace Improvements in Salt Lake.

In speaking of the Utah Qneen Company's works, the Salt Lake *Tribune* says: "We were favored yesterday with a call from Mr. Frank McLain, Superintendent of the Utah Queen Company's works (Carson & Buzzo). He speaks in high terms of praise of Mr. Stephen Veitch's improved furnace, which was put np early in May, and has been in constant use since that time, without stoppage. Dnring this period it has made four runs, and bas done the cleanest work ever known. The inventor of this improved furnace had charge of it about six weeks, when he resigned and was succeeded by Mr. G. Garrish. The present Snperinteudent, Mr. McLain, snceeeded Garrish Jnne 1st, and is still in charge of the works. Tbe improvement introdnced into this furnace is its corner fastenings, which secure it against expansion, and thus increases its durahility. The invention was first tried hy the Swansea Melting and Refining Company, of Chicago, to whom it gave entire satisfaction. From there Mr. Veitch was called to erect the one spoken for Messrs. Carsou & Bnzzo; and Mr. McLain prononnces it good for two months' service yet. A waterjacket furnace held in reserve against accidents, has not been called into nse, and, according to present indications, it is not likely to be. Mr. Veitch uses the Utah firestone in the construction of his furnace, and the serviceable properties of this stoue are fonnd to be nnsurpassed.

Capt. M. E. Smith, formerly connected with Holden's Iron Works, of Chicago, is the general Superintendent of the Utah Queen Company, and this geutleman is highly commended hy Mr. McLain, as very efficient and faithful in his services, and possesses that instinctive knowledge of men which enables him to exercise control without the least friction or misunderstanding. The product of bnllion at these works averages five tons a day, tbe ore extracted averaging eighty to one hnndred onnces to the ton; the infusion of lead is very light. Operations are suspended for the present, in consequence of some defect in the boiler. A new boiler is on the ground, however, which will very shortly he put in place. A large quantity of ore is at the smelter, awaiting the resumption of work."

Salt Lake Iron Works.

We dropped into the Salt Lake Iron Company's works yesterday, and fonnd tbis very useful establishment rnnning fnll handed. Qnite a number of heavy castings are now in hand designed for a fifty-two horse-power engine, which is heing repaired and remodeled for Messrs. Howard & Layton. It is intimated that these two gentlemen design erecting a grist and flouring mill in this city, for use in which this powerful engine is heing prepared. Thirty-five workmen are constantly employed here, and are among the most skillful in their line to he fonnd in the West. Mr. L. V. Sutherland, the manager, shows fine execntive ability, and everything rnns along with the regularity of clockwork. Tbe business consists chiefly of repairs to mining and milling machinery, and tbe great advantage of such an establishment, where castings can be made and repairs executed without the delay occasioned hy sending to a distance, is highly serviceahle to onr whole mining interest. A recent advance of $100 a car on iron carried from Omaha to Ogden Jnnction is complained of as a hurdensome imposition, and bas the effect of raising the price of work, which results unfavorably to all classes. This enterprising company has recently pnrchased the vacant lot north of the bnilding, and we understand they pnrpose pntting np an addition to their shops thereon.—*Salt Lake Tribune.*

OZONE BY SLOW OXIDATION.—If a small quantity of henzine he placed in a large vessel and exposed to direct sunlight for a few days in summer, the vessel heing frequently opened and shaken, the air in the vessel will contain ozone. The same change will take place in diffused daylight, or even in the dark, and at a low temperatnre, hut a mnch longer time is required.

Useful Information.

Advice to Bathers.

Mr. Lambton Young, Secretary of the Royal Humane Society, publishes the following excellent advice to bathers:

Avoid bathing within two hours after a meal.

Avoid bathing when exhausted by fatigue or from any other cause.

Avoid bathing when the body is cooling after perspiration; but bathe when the body is warm, provided no time is lost in getting into the water.

Avoid chilling the body by sitting or standing naked on the banks or in boats, after having been in the water.

Avoid remaining too long in the water but leave it immediately if there is the slightest feeling of chilliness.

Avoid bathing altogether in the open air if, after having been a short time in the water, there is a sense of chilliness with numbness of the hands and feet.

The vigorous and strong may bathe early in the morning on an empty stomach; but the young and those who are weak had better baths three hours after a meal; the best time for such is from two to three hours after breakfast.

Those who are subject to attacks of giddiness and faintness, and those who suffer from palpitation or other sense of discomfort at the heart, should not bathe without first consulting their medical adviser.

To Cut and Bore India Rubber Stoppers.—Dip the knife, or cork-borer, in solution of caustic potash or soda. The strength is of very little consequence, but it should not be weaker than the ordinary re-agent solution. Alcohol is generally recommended, and it works well until it evaporates, which is generally long before the cork is cut or bored through, and more has to be applied; water acts just as well as alcohol, and lasts longer. When, however, a tolerably sharp knife is moistened with soda lye, it goes through the india rubber quite as easily as through common cork; and the same may be said of a cork-borer of whatever size. We have frequently bored inch holes in large caoutchouc stoppers, perfectly smooth and cylindrical, by this method. In order to finish the hole without the usual contraction of its diameter, the stopper should be held firmly against a flat surface of common cork till the horor passes into the latter.—*Ex.*

Uses of Rawhide.—The skin of an animal, whether cow, calf, colt, or horse, that dies on the farm, is worth more at home than at the tanner's. Cut it into narrow strips, and shave off the hair with a sharp knife before the kitchen fire, or in your workshop, on stormy days and evenings. You may make them soft by rubbing. A rawhide halter-strap an inch wide, will hold a horse better, and last longer, than an inch rope. It is stronger than hoop-iron and more durable, and may be used to hoop dry casks and boxes, and for hinges.

Try it on a broken thill, or any wood-work that has been split. Put it on wet, and nail fast. Thin skins make the best bag-strings in the world. A rawhide rope is a good substitute for a chain. It is valuable to mend a broken link in a trace-chain. For other purposes it may be dressed soft.—*Boston Journal of Chemistry.*

Various methods are proposed by which to utilize the blast furnace slag. It is an interesting fact that what was not long since regarded as a troublesome and useless by-product has come to be regarded as one of positive value. Among the latest of these new methods is that by which slag is made to serve as a valuable constituent of an artificial pumice stone. The slag is first granulated by allowing it to fall from a hight into a stream or tank of water; the granules thus formed is mixed with hydraulic cement or ordinary slaked lime. This mass, while soft, is pressed into brick-shaped molds; the bricks, after two weeks' exposure, become hard and durable.

Home Made Picture Frames.—Cut strips of stiff pasteboard, about an inch wide, the desired length, clip the ends to a point, and cover with any nice black cloth, like broadcloth or fine cassimere; lap the ends at the corners of the frames and fasten with a white or gilt button. Bind your picture and glass together with strips of gummed paper and glue, on to the frame. Hang against a white wall. Bronzed paper, which can be bought for eight cents a sheet, may be used instead of cloth, in which case a short strip across the corners of the frame is a great addition to its comeliness.

To Clean Furniture.—An old cabinet maker says the best preparation for cleaning picture frames and restoring furniture, especially that somewhat marred or scratched, is a mixture of three parts linseed oil and one part spirits of turpentine. It not only covers the disfigured surface, but restores wood to its original color, and leaves a luster upon the surface. Put on with a woolen cloth, and when dry, rub with woolen.

Converting Weeds Into Manure.—A ready method of utilizing weeds and garden refuse so as to convert them speedily into valuable manure, consists in laying them in a trench in successive layers, with unslacked lime between, and then covering the whole with earth.

Aseptin for Preserving Meat.—Mix equal parts of pure boracic acid and common alum. To one barrel of meat, 8 ounces of this mixture will be found sufficient. Aseptin for preserving milk or beer is composed solely of boracic acid. Of this, 15 grains added to 2 pounds of milk will preserve it for 120 hours, whereas the same would sour in 36 hours. Beer is said to be improved by it, and the same is doubtless true of cider, porter, etc.

Artificial Coal.—To two drachms of vermilion add one ounce of resin, and melt them together. Have ready the branches or twigs peeled and dried, and paint them over with this mixture while hot. The twigs being covered, hold them over a gentle fire; turn them round till they are perfectly smooth. White coral may also be made with white lead, and black with lampblack mixed with resin.

Salt is a simple remedy for many things. It will cure sick headache, make cream freeze, make the butter come, take ink stains out of cloth of any kind, kill worms, make the ground cool, so it is more congenial to celery, cabbage, etc.; ease the itching pain caused by irritable skin diseases, like hives, etc.; produce vomiting or stop it, as you like, and many other things too numerous to mention.

Temper of Tools.—A correspondent of the Detroit *Tribune* says:—If an edged tool is so hard as to crumble, grind it on a dry stone until the edge turns blue; it will then cease to break and the temper will generally prove to be about right. Scythes and axes are sometimes too hard at the edge, but if treated in this way will give no further trouble.

Polishing Wood in the Lathe.—After sand papering, a very little preparation is required. Fill up the grain with oil and plaster of Paris, wipe off clean, polish with French polish, and finish off with alcohol.—*Samuel Smither, London.*

Parchment Paper.—Dip the paper for a few seconds into a mixture of equal parts of sulphuric acid and water, and immediately wash off the acid, first with pure water, and then with dilute aqua ammonia, and dry.

Good Health.

Light as a Curative Agent.—The statement has been made that Sir James Wylie, late physician to the Emperor of Russia, having attentively studied the effect of light as a curative agent, in the Hospital of St. Petersburg, discovered that the number of patients who were cured in rooms properly lighted, was four times those confined in dark rooms. This led to a complete reform in lighting the hospitals of Russia, and with the most beneficial results. In all the cities visited by the cholera, it was universally found that the greatest number of deaths took place in narrow streets, and on the sides of those having a northern exposure, where the salutary beams of the sun are excluded. The inhabitants of southern slopes of mountains are better developed and more healthy than those who live on the northern sides; while those who dwell in secluded valleys are generally subject to peculiar diseases and deformities of person, these different results being attributed to the agency of light.

Treatment of Cholera.—A physician of New York, whose treatment in cholera has been very successful, writes to the *Times* as follows:

"First let me say that I have no 'stereotyped' mode of practice either for this or any other disease, which is so vauntingly put forth as almost oracular by many, who probably never saw a case of cholera; for it is well known that it assumes a variety of forms, and requires a varied course to suit each individual case. One of the most powerful aids we possess is the steam bath, and in the absence of proper apparatus, it can be effected by placing the patient in bed, and wrapping him in woolen blankets, wrung out of the water as hot as can be borne, and dry blankets over all. Cover the abdomen with a linseed poultice; bottles of hot water about him, and at his feet; ice to quench thirst. Frictions with dry flannels are useful, should they not produce spasms by too much motion of the patient; if so they will do more harm than good, and should be discontinued. Astringents, as tannin, and stimulants, as brandy, ether, ammonia internally, and moist heat externally, is the proper course."

Dr. Pecholier avers that a milk diet, if strictly adhered to, will relieve a person afflicted with certain forms of heart disease. Under the influence of this diet the impulse of the heart diminishes, together with the palpitation, and the congested condition of the face, the brain and the lungs. The patient experiences unexpected improvement, and by the adoption of this plan, life may be prolonged, even in cases where a permanent cure can not be hoped for.

Rest.—The best medicines in the world, more efficient in the cure of disease than all the potencies of the chemist's shop, are warmth, rest, cleanliness and pure air. Some persons make it a virtue to brave disease, "to keep up" as long as they can move a foot, or bend a finger, and it sometimes succeeds; but in others, the powers of life are thereby so completely exhausted that the system has lost all ability to recuperate, and slow and typhoid fever sets in, and carries the patient to a premature grave. Whenever walking or work is an effort, a warm bed and a cool room are the very first indespensible steps to a sure and speedy recovery. Instinct leads all beasts and birds to quietude and rest the very moment disease or wounds assail the system.

A Bath in hot sand is the latest discovery offered by a therapeutist of London, as an "infallible cure" for rheumatism. He claims that the advantage of this mode of treatment consists, especially, in the fact that it does not suppress perspiration like the hot-water bath, but rather increases it; and another advantage it possesses is, that it does not interfere with the respiration of the patient, as does the steam bath, or Turkish bath. It is asserted that the body can endure the influence of such a bath for a much longer time, and a much higher temperature can also be applied. It can be used for infants, and permits of easy application to a part or to the whole body. If this remedy shall prove efficacious for so serious an ailment, it will indeed be a boon to a large class of sufferers.

Fresh Air.—Live out of doors as much as you can. It is the place for a man to be. It is good for the health. A distinguished physician was in the habit of saying, "However bad the air may be out of doors, it is always worse in the house." It is good for the temper. People who are always shut up in a house are apt to grow fretful and peevish. They are prone to acquire narrow views of things, and to worry over trials not worth considering. It is good for the whole character—for strength, hope, patience and fortitude. It expands and softens one's nature, and makes us more charitable.

A Correspondent of the Maine *Farmer*, who frequently gets poisoned during haying by ivy, which grows on his place, recommends the following treatment: Take four ounces of sugar of lead, pulverize it, then dissolve it in one quart of cold water. Apply it to the poisoned parts whenever they begin itching or burning. In case the poisoned parts are badly inflamed and swelled, put on a bread and milk poultice, till the inflamation is out, then take half a cup of sweet cream, put in a teaspoonful of sugar of lead and beat it up until a salve is made of it; then apply it three or four times a day. It will also be well to take a little physic each day.

Chlorozone—A New Disinfectant.—A new preparation under the name of Chlorozone has been promulgated in London, and has even reached San Francisco. It professes to be a superior disinfectant — better than Condy's fluid. The London *Doctor* says it is nothing but Condy's fluid spoiled by the addition of chlorine.

An Anti-Neuralgic Snuff is made in the following proportions: Citrate of quinine 50 centigrs, tobacco, well fermented and irritant, one grain. This has been employed with success in cases of intermittent facial neuralgia.

Utilizing Old Iron.—It is well known that the more frequently wrought iron is worked over, the better it becomes. Acting upon the principle, all the axles with worn journals on the Central Pacific Railroad are now sent to Sacramento, and by a blow of the trip-hammer, the ends are cut off. These ends are thrown in the scrap pile, and are worked over as needed. The amputated axle is now upset, and the ends beaten out to a shape like a hollowed hand. Into this hollow a fifty-pound piece of fresh iron, at white heat, is welded and thoroughly worked upon the axle, which, being re-turned in the lathe, is found to be superior in all respects to completely new axles. Since the plan has been adopted, over ten thousand journals have been thus treated. The rapidity and neatness of the process will repay a visit to the works to witness it.

A manufacturer in Saxony claims to have discovered a method by which certain alloys of aluminum may be advantageously used in the manufacture of hair springs for clocks and watches. Hitherto the main difficulty in effecting this was that the rolling and drawing of the metal destroyed its elasticity, and it is in overcoming this obstacle that the novelty of the discovery consists. To effect this, the wire or band, after having been drawn or rolled to a proper size, is submitted to the action of a plane of peculiar construction, and afterwards trimmed to the proper size by grinding. The superiority of these springs over those of steel consists in their being less liable to oxidize, free from the action of magnetism, and less brittle.

Domestic Economy.

Colcannon.—Take half as much cauliflower as potatoes, both of which must have been boiled previously and completely cooled. Chop them separately and very fine. Put a little milk and butter into a saucepan, and when boiling hot, turn in the potatoes and cauliflower well mixed together. Place a flat tin or dish over them and let them warm through. Then remove the cover, and add salt and pepper to the taste; make the dish boiling hot, and serve. It is an excellent addition to a breakfast or a hot supper, and does not come amiss at a "picked-up dinner." Another way to prepare it is with strips of salt pork. Cut the pork into strips an inch long and as narrow as possible, and fry it to a crisped brown; then turn in the chopped cauliflower and potatoes, and mix them well with the pork strips and fat. Heat very hot, and serve on a platter. It is a delicious dish; and a little vinegar is considered an improvement to it.

Spiced Veal.—Chop three pounds of veal steak, and one thick slice of salt fat pork, as fine as sausage meat; add to it three Boston crackers, rolled fine; three well-beaten eggs; half a teacup of tomato catsup; a teaspoonful and a half of fine salt; a teaspoonful of pepper; and one grated lemon. Mould it into the form of a loaf of bread, in a small dripping-pan; cover with one rolled cracker; and baste with a teacupful of hot water and melted butter, with two tablespoonfuls of butter. Bake for three hours, basting every little while (this makes it moist). Make the day before it is desired for the table; slice very thin, and garnish with slices of lemon and bits of parsley.

How to Make Tomato Figs.—Pour boiling water over the tomatoes in order to remove the skins; then weigh them and place them in a stone jar, with as much sugar as you have tomatoes, and let them stand two days; then pour off the syrup and boil and skim it until no scum rises. Then pour as before, then boil and skim again. After a third time they are fit to dry, if the weather is good; if not, let them stand in the syrup until drying weather. Then place them on large earthen plates or dishes, and put them in the sun to dry, which will take about a week, after which pack them down in small wooden boxes, with fine white sugar between each layer. Tomatoes prepared in this manner will keep for years.

Tea Leaves.—Save the tea-leaves for a few days, then steep them in a tin pail or pan for half an hour; strain through a sieve and use the tea to wash all varnished paint. It requires very little "elbow-polish," as the tea acts as a strong detergent, cleansing the paint of its impurities, and making the varnish equal to new. It clears window-sashes and oil-cloths, indeed, any varnished surface is improved by its application. It washes window-panes and mirrors much better than water, and is excellent for cleaning black-walnut picture and looking-glass frames. It will not do to wash unvarnished paint with it. Whiting is unequaled for cleaning white paint. Take a small quantity on a damp flannel, rub lightly over the surface, and you will be surprised at its effect.

To Bake an Apple Perfectly, can only be done by giving it time, keeping it under heat—steady at that—for from four to six hours, depending upon the size and quality of the fruit. It requires this length of time to reduce it to a fine pulp and destroy all rawness. The flavor is changed and improved, making, if Spitzenburg or some other good fruit, one of the choicest and daintiest of dishes. The point in baking is to give all the heat that can be borne without breaking the skin, thus retaining the moisture.

Jellies. — In making jellies of apricots, quinces, peaches, apples or plums, peel, remove the stones or cores; cut in pieces, cover with water and boil gently till well cooked; then strain the juice gently through a jelly-bag; add a half-pint of sugar to a pint of juice. For berries, a pound of sugar to a pint of juice. Boil till it ropes from the spoon, or from 15 to 20 minutes. In making raspberry jelly use one-third currants and two-thirds raspberries.

Washing Powders. — Dissolve two pounds of soap in five and a half gallons of nearly boiling water, and to this add three large tablespoonfuls of ammonia, and one of spirits of turpentine. In this the linen is to be soaked for three hours, when it is readily cleansed, requiring but little rubbing. Ammonia does not affect linen or woolen fibre as soda does.

Buttermilk Muffins.—One quart of sour buttermilk, one teacupful of sour cream, two eggs, one teaspoonful of soda, a little salt, flour enough to make as thick as pound-cake. Bake in muffin rings, placed upon tins in the oven, from 20 to 30 minutes, according to the temperature of the stove.

Apple Pie.—Peel the apples, slice them thin, add a little molasses, and sprinkle sugar over them; grate on some lemon peel or nutmeg. If you wish to make it richer put a little butter on the top.

The Fire in the Yellow Jacket.

The Yellow Jacket has been an unfortunate mine, as regards fires. On April 7th 1869, occurred the great fire by which many lives were lost. The firs of the 20th instant, it is known, can hardly he called an accidental one. Warnings had already been given of danger from the blacksmith's forge on the 1,300-foot level. This forge belonged to the Belcher company and was in the Jacket ground because a more eligible situation was there offered. It was used for sharpening picks, drills and other tools, and might have been placed on the surfaces as well, for all purposes for which it was intended. Other mines in the vicinity had forges below ground, but there is no doubt but that a revolution will be effected by this disaster, and perhaps it will serve to prevent other and greater losses. But this is severe enough. Six men lost their lives, and many others were badly injured.

At about three o'clock, on the morning of the 20th, the fire was discovered. An hour or two previously, timbers in the neighborhood of the forge were found to be on fire, but this fire was put out, it was supposed. After the fire had been burning some time, gas was accumulated and produced an explosion. This and the asphyxiation destroyed the lives of those who were lost. Every effort was made to save them, and their bodies were recovered with great difficulty. The fire did not injure the mine to any great extent, and was soon got under control. Let the lesson taught by this disaster be appreciated, and its occurrence will not have been altogether in vain.

AN OREGON genius, named Branson, is the last man who has discovered "perpetual motion," and won't show anybody the machine in operation.

THE Virginia and Truckee Railroad is bringing large quantities of wood to the various mines and mills on the Comstock for winter use.

The Fall of the Railroad Speculators.

It is to be hoped that the recent financial break in New York will open the eyes of the country to the folly and wickedness of stock gambling, and drive from such business not only all reputable banks, but every respectable individual as well.

If railroads cannot be built without resort to such speculative, illigitimate practices, better let the country wait until there is an actual paying demand for them. As the practice now is, railroads are built upon the proceeds of bonds sold at a discount of from 20 to 35 per cent or more, and then the people are taxed by the extra amount on freight required to bring such bonds up to par; or in other words to pay the full interest on a road which has cost 20 or 35 per cent more than it should have cost. In this we say nothing of subsequent watering of stock, exhorbitant interest demanded, or extravagant or plundering management, to all of which additional charges many, if not most of our roads, are more or less amenable.

There is no doubt but the recent exposures of the scandalous conduct of our railroad managers, as developed in the Erie and other railroad rings, in the Credit Mobiliers, the Contract and Finance Companies and the various other wheels within wheels, added to their late attempts to control Legislatures, Conventions, etc., and to corrupt Congressmen, Senators and others in high places, have been the indirect cause of the late refusal of capitalists, both at home and abroad, to invest farther in railroad securities. Judging from the scandalous management of the past, there was no telling what further and still more disreputable complications might not be attempted or reached in the future. Hence the only safety for prudent and honest capitalists lay in a determination to have no more to do with such a disreputable, speculating class of men; and the consequence was that the bubble burst.

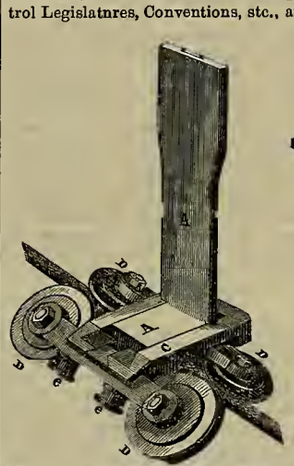

FIG. 4. PERSPECTIVE VIEW OF GRIP.

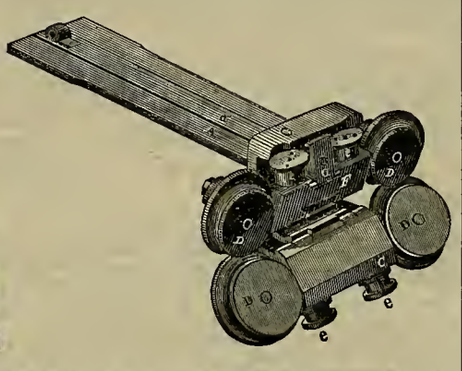

FIG 5. VIEW OF GRIP FROM BELOW.

The people may feel thankful that the end was reached so soon; or otherwise the disaster might have been more wide-spread. As it is, the crash is confined almost exclusively to speculating bankers and brokers. No well managed banking institutions have been seriously moved; while merchants, manufacturers and others who control the great volume of the business of the country, as well as our great producing interests, are scarcely affected at all. There will soon be a clearing up of the financial horizon, and a purer and more healthy condition will follow.

One of the most gratulatory facts connected with the "panic" of Saturday and Sunday, in New York, is the firmness manifested by President Grant, when he was beset by Gould, Vanderbilt, Drew, and others, who made frantic efforts to wring from him the currency reserve belonging to the people, with the millions of which they hoped to save themselves and friends from the fate they so justly merited. The victory won on Sunday last, at the Fifth Avenue Hotel, over the enemies of the people, was not of less importance to the country and his own reputation, than was that in the swamps before Richmond. Beyond the buying of a few more bonds than usual to help out the legitimate banks in the run of Monday—all that he felt called upon to do—the speculators were left to to their fate, and all the people say amen.

It may be years before the companies most adversely affected will recover from the shock. Perhaps it would be well if they never recovered until honest and fair-dealing men are placed at their head. The railroads of the country must come under the management of prudent and honest men, ere the present "unpleasantness" is done away with and peace proclaimed between them and the people. There will be no peace so long as the Fisk school of financiers continue to control the great thoroughfares of the country in the special interest of speculators, instead of that of the people for whose benefit they were *professedly* built, and by reason of which profession every man's homestead in the country has been willingly mortgaged, while many have been even given up their hearthstones to make way for the iron horse.

The Polaris Expedition and its Results.

Since the miraculous escape and return of Capt. Tyson and his party the whole world has been anxiously awaiting tidings of the Polaris and those left with her. Now that news is received of the safety of the second party, the mystery in regard to the death of Capt. Hall and the separation of the crew is as far from solution as ever. The unexplained is always suspicious, and men affix suggestions of hidden evil to whatever they cannot understand.

On the 15th of October, 1872, while part of the crew were on the ice floe at work removing provisions and other necessaries, preparatory to leaving the ship, which was in a damaged condition and leaking badly, the Polaris was torn from its moorings in the ice by a sudden movement of the floe. This was the last seen of the vessel by Capt. Tyson, the story of whose adventures is so well known. The Polaris, without boats, with but half a crew and still leaking, drifted helplessly through the ice, and it was decided to beach her. The winter was passed on shore, the men being assisted by friendly Esquimaux. In the Spring boats were built from material taken out of the ship. In these a perilous cruise southward was made, and on the 23d of June the men were picked up by the Ravenscraig, of Dundee. From her they were taken by the steamer Arctic to England. They are now on the way to this country. A searching investigation will be made, it is said, which will at last give the full history of the expedition.

Notwithstanding its unfortunate end, the cruise of the Polaris has not been without important results. Capt. Hall had prudently left records of the earlier discoveries behind, when the last move northward was made. All papers not now in the hands of Capt. Buddington are probably "cached" in Polaris Bay. The expedition reached a latitude of 82° 14′, said to be the highest yet attained.

COPPER.—James Lewis & Sons' monthly report on ores and metals (Liverpool) for September says that there is a very noticeable reduction in stock of copper during the past month and the shipments from Chili show a falling off as compared with last year. Quotations on the 1st inst., were—ore 45s. 6d. to 16s, 6d.; Regulus 16s. to 16s. 6d. per unit. Lota and Urmenta Bars £84 to £85. Good ordinary brands £85 to £86 per ton on the spot. Chili exports to August 2nd amounted to 19,668 tons Fine as compared with 25,292 tonain same period in 1872, and 26,415 in 1870. Stocks of west coast produce are estimated at 22,043 tons Fine, against 22,658 tons on 1st ultimo.

THE Justice Mining Co. are building a new oredump of larger capacity than their old one.

A Novel Railroad.

Many of our readers have observed the work of constructing a peculiar kind of railroad on Clay street, above Kearny, in this city, which has been put in operation within the past few weeks. We devote this week a considerable portion of our space to the description and illustration of this work, which promises to be of so much importance to the "Russian Hill" portion of the city, and is an important enterprise in an engineering point of view, containing many points of engineering interest, especially in the matter of the economical transportation of passengers through densely populated cities up steep grades.

About four or five years ago a gentleman in this city drew the attention of Mr. A. S. Hallidie to the importance of providing a more reliable and rapid mode of reaching the summit of the hills to the west of the city, and urged him to give the matter his attention. Mr. Hallidie, who was then engaged in experimenting on modes of transporting material over mountainous roads by means of endless-traveling ropes, at once put his mind to work and brought forward his plan, substantially as adopted by the Clay Street Hill Railroad, and which he submitted to a number of engineers, among them, Mr. D. R. Smith, now of Canca, U. S. Colombia, Mr. Huttner, now of Virginia City, and Mr. Eppelsheimer, of this city. The last-named gentleman, a highly educated engineer, was finally engaged to work up the details, has made all the drawings and superintended the construction of the road.

The summit of the hill is 307 feet above Kearny street. This incline runs on Clay street, has a double track, and is 2,800 feet long; the rope then runs down over the summit 500 feet, with an incline of 15 feet, to the engine-house on Leavenworth street. This makes the entire length operated by steam 3,300 feet. The projectors originally thought of running up California street, but that street runs on the south slops of the hills, leaving considerable of the population to the north of it, and does not reach the summit. The mechanical difficulties of running up California street would not have been so great, but it was a question of financial success, and the projectors determined on Clay street, on account of its passing through a denser population, the street itself not being so objectionable as Sacramento street, adjoining, its lower terminus being central, and this street reaching the summit of the hill. Clay street is densely populated the whole distance; it is, however, a narrow thoroughfare, its width being only 49 feet. The grades are as follows:—from Kearny to Dupont, 45 feet; from Dupont to Stockton, 45 feet; from Stockton to Powell, 62 feet; from Powell to Mason, 42 feet; from Mason to Taylor, 48 feet; from Taylor to Jones, 67 feet. The average grade is 580 feet to one mile. Clay street runs at right angles to the above streets, which have widths varying from 45 feet to 68 feet 9 inches. A section of Clay street hill, between Kearny and Leavenworth streets, showing the grades, will be shown in Fig. 1. The steepest grade is 850 feet to the mile.

The system submitted by Mr. Hallidie, and determined on by the company, was that of a constantly traveling endless steel-wire rope, and the conditions to be met were—that the road should present no more serious impediment to ordinary travel than the usual street railroad; that the rope should be below the surface of the street; that the car could be instantly stopped on any part of the road; that it should be worked more economically than with horses; that its mechanical construction and management must be simple and easily controlled, and that no motor should be used in the more populous portion of the street that would frighten horses or endanger lives.

These conditions entailed considerable mechanical difficulty. We have made a pretty thorough examination of the work, and will endeavor, with the aid of the accompanying cuts to impart a clear idea of the mode of construction in detail. Figure 2 shows a longitudinal elevation of the line through which the rope travels, showing a portion of the rope, dummy with gripping attachment, and car with safety brakes attached. Figure 3 shows the method of applying the power from the engine to the rope at the engine house corner of Leavenworth and Clay streets. Figures 4 and 5 represent the gripping attachment which is hereinafter

described. Figure 6 is a cross section of the irnn tnbe, showing the menner in which the rope runs over the pnlleys. It also shows the method of gripping the rnpe by the gripping attachment. When the rope ia gripped by the jaws, the whole attachment is raised, and passes clear of the pnlleys, bnt nnder the surface nf the street. This raising is accomplished by means of screws, shown on the dummy, Fig 2. It will he seen from this that the adjustment of the grip is such that it clears all the pnlleys and evcrything else.

The general arrangement is as follows: An endless steel wire rope, three inches in circnmference, 6,800 feet long, weighing 9,600 ponnds, and made of 114 Johnson & Nephew's No. 16 gange patent steel wire, hardened and tempered, is stretched the whole distance of Clay street, lying in iron tubes, snpported every 39 feet nn 11 inch aheaves. This rope is snpported at every change nf angle at the lnwer orossings on sheaves four feet in diameter, passing around a sheave eight feet in diameter at the lower end nf the line; and at the engine house aronnd two engle sheavcs, each eight feet in diameter, which lead the rope on to the grip pnlleys, also eight feet in diameter (Figure 3), and which are nttached to a patent safety gear driven hy a 12x24 engine.

In addition to the sheavee thet support the rope in the tnbee, at each npper side of each crossing where the incline makes an angle npwards there are eheaves in the tnbes that keep the rope down and from striking the npper part of the tnbe. The patent grip pulleys being furnished at their circnmference with jaws that grip and releese the rope antomatically by the pressure of the rope in the jaws, prevents the rope from slipping; and being eet in motion by the engine actnates the endless rope, one part of conrse traveling np ono tnhe, and the other down the other tnhe. By referring to the cnt showing the cross sections of the tnbe, (Figure 6), it will be seen that there is en opening in the npper side of the tnbe. Thie opening runs the entire length of each tube, forming a long slot seven-eighths of an inch wide. Thie slot ie not immediately over the center of the tnhe but on one side, so es to clear the npper sheavee end to enable the foot of the gripping ettachment to pass by end under the npper sheaves, and over the lower eheaves in the tnbe.

The connection between the cars on the street, and the traveling rope, is made by means of this gripping attachment, which plays an important part in thie system, and is horeinafter described. The cars are made to seat ebout 14 paesengers, but not eeldom es many es 44 have ridden in them, and nine on the dummy, 53 in all. The traction car, or "dnmmy," with the gripping attachment ie shown in Fig 2. This car is attached to the paesenger car firmly, so that there can be no danger of accident. The paeaenger car is amply provided with brakes. In addition to the nsual car brake, there is anothher attachment operated in the same manner as nrdinary brakes, which forces a broad band of wood down on each track immediately under the car. Thie arrangemeut ie ehown in figure 2. Strong iron drags are provided, eo that if an accident should occur in going up the hill, they will immediately catch in the street planking, and prevent the car from going backwards.

Since the road has been in operation, owing to some poor material furnished, the connection between the "dummy" and the passenger car broke, on the steepest grade. Before the car weut more than a few feet the brakes effectually etopped its furthor backward progress, shnwing conclnsively that the precautione adopted were effectnal. The car was crowded. at the time. The "dummy" is also provided with a powerful brake. By thie means the car can be stopped at any place on the route, stoppagee not being confined to street crossinge where it is level. The "dnmmy" and car are connected with "bumpore" eo that the weight of the car going down comes on the rope and is utilized to draw up the other cars on the other track. The brakee are nsually not usod when coming down, except when it is necessary to stop, the car running down with the same speed as the rope, since the gripping attachment in connection with the rope. Figure 4 shows perspective view of the Hallidie patent gripping attachment (which has been improved by Mr. Eppelsheimer) showing it from above, and Fig. 5 shows it from below. A vertical slide, a, works in a standard, A, and is moved np and down by a screw end handwheel. This screw is shown on the cnt of dummy, Fig. 2. The small npper screw going down through the large screw, operates it. At the lower end of this slide, a', is a wedge-shaped block, a. The wedge actnatea two jaws, C, F, horizontally, which open and close according to the direction in which the slide, a', is moved, closing when the slide is moved npwards. These jaws have pieces of soft cast iron placed in them, which are easily removed when worn nnt. These pieces of iron are of proper shape and size inside to grip the rope when they are closed over it.

On hoth sides of these jaws and attached to them are two small sheaves, D, D. These sheaves are held by means of rnbber cushions, e, e, e, e, sufficiently in advance of tho jaws to keep the rope off from the jaws, and at the eame time to lead the rope fairly between them, allowing it to travel freely between the jaws, when they are separated, without touching them. When it is required to grip the rope, this elide, a', ie drawn up by meens of the small screw before described end the wedge, a, at the lower end closes the jews over the rope, et the same time forcing beck the small guide sheaves D, D, on to the rubber cushions. The etandard, A, containing the slide, etc., is enclosed and retained in a cast-iron bracket, shown on the dummy, Fig. 2, and raised and lowered bodily through an opening in the tube from above the surface of the street to the rope in the tube by means of a worm aud nut or rack aud pinion. In this case it ie raised by a ecrew and nut shown on dummy, Fig 2. The cast iron bracket is eecured to a skeleton or traction car called a dummy, as shown in Fig. 2. The dummy is coupled to the passenger cars, at the bottom of the incline, and uncoupled at the top and *vice versa*, horses then being conpled to the car for the level road. At first the connection between the dummy and car was made hy means of spiral springs, to prevent any jar in starting np, bnt this was found nnnecessery. The arrangements made at the bottom of the inclue for keeping tho rope et the proper tension, and taking np the slack, prevent any noticeable jar in starting. As before stated, the rope is constantly in motion, running between sheavee pleced in the tnbe. The slot of the tube is on one side of a vertical line drawn thronh the center of the tnbe, and referring to Figs. 4 and 6, it will be seen that the foot of the gripping ettechment projects on one side, giving it an L shape, enahling the jaws to pass nnder end over the rope sheaves in the tnhe. In nrder to stop the car, the jaws of the gripping attachment are opened slightly; when they release the rope, the guide sheeves take it and the car stops.

The shank of the standard, A, containing the slide, a', which works in the slot of the tube, is ¼ of an inch thick and 5¼ inches wide, there being ¼ play on each side; all the essential parts of the gripping attachment are made of steel.

The turn-table at the foot of the incline, constrived by Mr. Eppeleheimer, is double. The available space at thie point wae very limited, and in view of this, some ingenuity hed to be employed. When the traction cer reaches the foot of the incline, it ie nncoupled from the car and run on to the turn-table, the slot in the turn-table allowing the ehank of the grip to pase freely down. The table ie then turned aronnd one quarter of its circumference, and the track and slots are then brought in the same line. The traction car ie then run on the other table, which is turned back and the traction car is run on the np track. The car ie then brought on the tnrn-table, transferred in the same manner and coupled to the traction car, ready for the ascent. This course ie necessary, as there are double tracks; and the traveling wire rope rnns down beneath one pair and up under the other. As the gripping attachment passee down under the street through the slot, it is necessary to have a slot in both turn-teblee to allow the traction car to be turned.

It hae been found that this method of turning around is rether slow, and other arrangemente are to be made to facilitate affairs. The method adopted at the upper end of the road is more simple. A turn-out ie made for the car, and it runs down to a common single turntable. The dummy is turned as follows: a circular table connects both tracke, with a slot described around a center. A small irou triangle connects the dummy at two pointe with the ceuter of the elot and tube. By pushing on the dummy, the center of thie iron triangle being held in position by appropriate means, the dummy tnrns aronnd in a very emall circle, and ie ready for the return trip when attached to the car, which has already been turned on the tnrn-table.

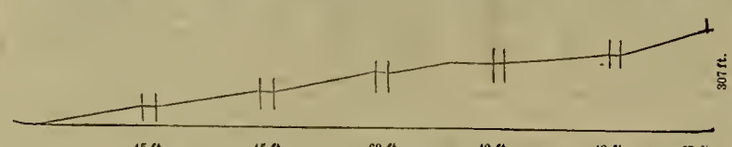

FIG. 1. SECTION OF CLAY STREET HILL.

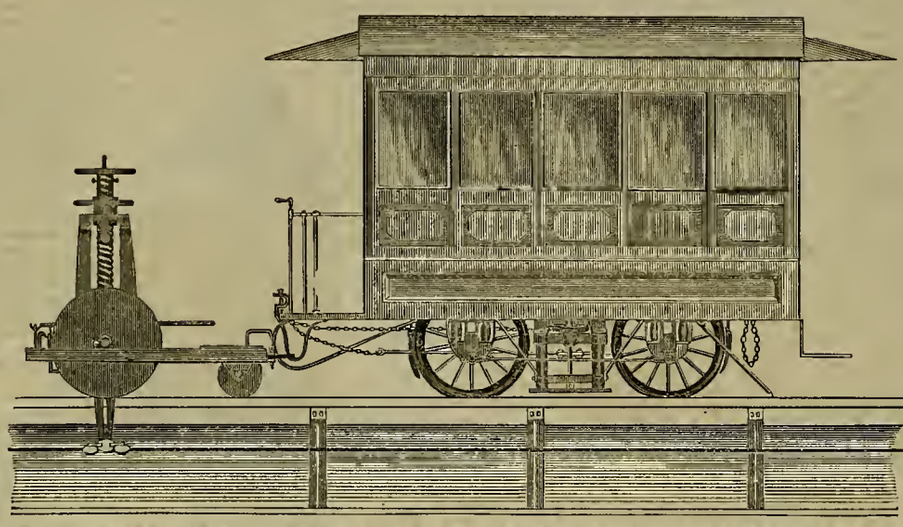

FIG. 2. PASSENGER AND TRACTION CAR, GRIPPING ATTACHMENT, WIRE ROPE AND SIDE SECTION OF TUBE.

FIG. 3. APPLICATION OF POWER TO ROPE.

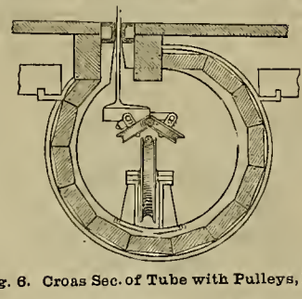

Fig. 6. Croas Sec. of Tube with Pulleys, Etc.

The road haa a gauge of 3 feet 6 inches. An ordinary 20 pond T reil is nsed, which is set flush with the street and presents a neat, smooth appearance. The rope runs at the rate of abont four miles per hour and the ascent is made, including stoppages, in abont 11 minutes, the distance being 3300 feet. The stretching arrangement at the lower end has a counter balance of 3,000 ponnds weight on a donble purchese, which keeps a constant strain on the rope under all circnmstances. The motive power is snpplied by a steam engine nf 30 horse-power and is transmitted throngh one nf Eppelsheimer's patent safety hoisting gears, an exceedingly effective and well adjnsted machine well worth the attention ot mining companies end those using hoisting machinery.

The rope rnns around the inclined horizontal pnlley, shown in Fig. 3, then down under one of the Hellidie patent grip pulleys; over it to a plain pulley and back again to another grip pulley fastened on the samo shaft on the first grip pulley, then guiding back to the second horizontal pulley in the street again. These pulleya are driven by patent geering which works very effectually, and is well worth seeing. This is made so as to stop the rope autometically in case of any nnusnal strain. This machinery is so arranged that the wire rope passes for some distance in open view of the engineer, so that it can readily he examined at any minute. This arrangement was necessary as the rope runs up the middle of the street, and the engine and machinery are of conrse on one side of it.

The office, depot, engine and boiler houee of the company is located et the intersection of Leavenworth and Clay etreets. From this point the hill rapidly descends to the north, eouth and weet, so thet if it ie fonnd edvisable at any time to uso a rope for hanling cars from any nf these directions to the top nf the hill, it can be done from this point. From the intersection of Jones and Leavenworth etreets the road ie en ordinary horee tramway and runs one mile north to the intersection of Cheatnut and Lerkin etreets.

The ntmost vigor has been dieployed in the conetruction of the road, the ground having been first broken on the eecond dey of Jnne of this year, and the first cer wae run over the road on the 2d day of August. At this time it worked so well that an additional block of the eame conetruction, which was before traveled over by horses, waa eompleted. Thie neceesitated some little delay, which the skepticel augured was a prognostication of failure. The road is not ae yet fully stocked, all the care required not heving been finished. It hae beenvery snccessful eince ite inception, the cers running full all the time. The inhebitents of that portion of the city benefitted by the road patronize it well, and numbere of people frequently ride for the novelty of the thing.

W. H. Mertin and Company were the contractors for the construction of the road, end the engine, boiler end driving mechinery were made at the Risdon Iron and Locomotive Works. The gripping attechment and traction cers were made at H. J. Booth & Co.'e Iron Works, and the cars for the road by the Kimball Mennfacturing Company. The wire rope was mede at Hellidie'e Wire Rope Worke. The cost of building and eqnipping the road is ahout $100,000, the incline portion costing about $60,000. Many people coneider the hill the beet portion of the city for residences, and the road brings within five minutea of the city hell a lerge emount of property that wes comparatively worthlees on eccount of the difficulty of eccese.

Much credit ie due the projectore of thie road for the energy they have displayed in pushing the work through in the face of almost insurmountable obstacles, and the engineer of the road, Mr. Eppelsheimer, hae shown great excellence of judgmeut and economy of conetrnction. Many people thought that the road would not be a success and that it would be a dangerone proceeding to draw cars up that steep hill. Every precaution, however, has been taken against accident and all the machinery ie strong and durable. The whole affair wae planned in this city and none but home indnetries were patronized in carrying out the details of the work. The cars are running regnlarly and the machinery all works well.

In Memoriam.—We see by the Nevada *Transcript*, that M. S. Deal who hes been editor of that journal since 1864, is dead. Mr. Deal was horn in Friendship, Maryland, on November 4th 1838 and came to California in 1858. Since his location at Nevada city, Mr. Deal hae filled several pnblic officee; he was twice elected County Superintendent of Public Schools, and served out both terme with honor to himself and great advantage to the public schools; was appointed Justice of the Peace to fill a vacancy, and by the ability and impartiality of his judical conrse won the confidence and esteem of the public. In 1871 he waa elected District Attorney of Neveda county, and proved himself en houest, able and efficient representative of the people's interest in all matters within the purview of his duties. He leaves a wife and three children to mourn his loss.

Cornucopia District.

The following eccount of the new mining district in Nsveda, is by a correspondsnt of the *Call*, and es it is more full than any dsscription we have seen, we give it entire :—"Being deeirous of correcting some wrong impreesions which have crept into the Bay City papers regerding the mines here, I will put down a few fects regarding them, which may be of nse to your many readers. At leest they will eerve to disprove those statemente to which I refer, end by which the Press of your city has been victimized.

History of the Mines.

These mines are, by the new stage road, sixty-five miles northwest of Elko, in Elko County, Nsveda, and were discovered by Mr. Durfee, about three yeare since—he, in company with Mr. Nash, heving been here each successive eummer for three years proepecting for gold. To nnderstand this fully, we must firet nnderstend that to the north and eest lie tbe Burro, Cope, Mountain City, and Bull Run Mining Districts, eech cerrying base mctal and copper-colored ore. To the sonth lies the Tuscarora District, a gold-bearing one. All theee districte are distant in a radins from this center not more then 25 miles, in the South Mountein, War Eagle or Silver City spure of the Great Goose Creek range of mountains, which finds ite western terminus on the North Humboldt River. From these hills spring the head waters of the Owyhee, which, through the Snake and Columbia Rivers, finde an ontlet to the ocean. Tbis has generally been considered a favorable country for gold, Tuscerora heving rich placer and quartz deposits of the yellow metal. Hence these prospectors missed the silver lodes while hunting for gold. Two yeare since Mr. Durfee told J. Coffmen, then at Bnll's Run, that he had a good thing here he believed; but then Bull Run was in its palmy etete, end Coffmen would not leeve his business to visit the new locelity, only 14 miles distent. That summer Durfee broke rock from the Leoperd croppings, but did not know its value. The sulphuret stein he took for slete ; but he hed a piece rich in horn-silver crnshed and assayed iu Elko for gold, and, of course, none wes found. Thus time passed until this seeson, when he made another trial of the place. This time he hed some rock assayed for silver, and wes amezed at the result—over $500 per tou from the Leopard, and over $17,000 per ton from the Chloride ledge. This was about tbe 12th of Jnly, and he returned and located the claims on the 23d of the same month. The news got out, end on the 1st of August a party, consisting of J. Coffman, J. Sinclair and the Tucker boys, came in and located. On the 6th the representative of the Sacremento *Record* and a party errived and made the first report of the minee. Since then the influx of miners hes heen steady, meny of whom bave located claims and become permanent citizens here.

Present Situation of the Mines.

At present, the permanent population is 150 to 200, witb about an equal number of comers and goers. About 30 buildings, including stores, hotels, saloons, etc., heve heen erected, and more are in progress of erection. Up to date 43 claims of all kinds have been recorded, and most of them ere beiug worked. The Leopard, Chloride, Constitntion, Monarch, Nortb America, Orphan Boy, Emme and other ledges have been opened end defined, and, to all outside appearanccs, are destined to prove rich and permanent. There is no wood under 12 or 15 miles, and no sage-hrush near by. Waterpower is ahundent, the Owyhee being being within four miles, and Bull Run Creek within 10 miles of camp. Springs are plenty on the mountain tops and in the ravines, and tbe water thereof is excellent. The winter season will commence about January 1st, when snow fells usually from six to eighteen inches deep. The worst seaeon here ie the spring, and not until July is it considered safe to attempt heavy trensportation over the mountain roads. The whole country is one vast and excellent stock range for snmmer, but too cold on an average for winter grazing. So much for the country, its generel features and locetion. I forgot to add tbet the streams abonnd in tront and salmon, the hills with sage hens and preirie chickens. Now a word as to our status and mines.

Prospects for the Future.

We have hed no Vigilance Committee, and don't expect to need one. We have had jumping of claims, and expect more, for that belongs to a new community. We mnet expect that where a few try to hold the whole country, without working their claims, they will have eome of them taken from them. The morals of the camp will compare favorably with those of older localities. As soon ae conflicting titles shall have been settled, and men know they are developing their own ledges, the prosperity of this camp will have been assured at once; for there ie no question but that a vast amount of wealth is here, to be had for the seeking. The Oracle Mining Company, of Sacramento, have good and rich ledgee, and one company from your city, represented here by Mr. Reese, have also a splendid claim, probably the richest in the camp. The Leopard and Chloride ledges are being worked, with prospects of great returns ; Coffman & Co. are workiug their ledges with flattering prospects. Mr Freeman hae disposed of two-thirds of his half in the Leopard, and I think Mr. Durfee hes sold his half in the same claim, hut it is not yet known for a certainty, or ths prics peid in eithsr cass. In conclusion, there hes been no exodus from the camp, altbough ths *Chronicle* says thers hes been. Men come and go all the time; some, who are plsased with the prospects, stay, others leave disgusted, eeying the country hes 'all been gobbled up.' The latter class wonld prospect for e lode of nothing less than $20-dollar pieces. Silver-hunting is too small game. Meny adverse reports have been made hy disappointed fortnne-seekers; but I assnre yon that no camp in Nevada ever had brighter prospects for the future than Cornucopia has and will heve when the claims now proved shall have been developed. The country, though heavily located with worthless claims, has been herdly prospected as yet, and untold wealth lies here waiting to be developed. I would not advise any one to oome here unprepared to lose some money before they cen bope to win. Bnt the prospector, prepared to search the country, will find in this district ample reward for his labors. In a few weeks' time leborers here will be in demand; at present we have plenty. It is one of the finest openings for a mill I have ever seen, tbonsends of tons of ore that will mill from $100 to $500 being in sight and awaiting a chence to be worked.

With this hasty sketch I close, promising you MORE ANON."

A Rich Ledge.

Near the summit of a mountein south of Taylorville, is the noted quartz ledge, or more properly, gold ledge, owned by A. C. Light, an old resident of Plumas county. The ronte leadiug to the mine is a mere trail and tbe only method of approaching is on foot, owing to the precipitous charecter of the hill. The ledge itself, if it cen he named a ledge, is a mere disjointed thread of gold-beering quartz lying in a hed or slide, of decomposed gneiss. The quertz rerely attains to the thickness of six inches and mainly does not exceed two inches in diemeter. The rich stringer of which Light's ledge ie a fragment, probably ren perellel with the Preminm originelly, end was deflected from its southeest course at this point by volcenic distnrbences.

This queer little quartz mine hes for years heen the most notable gold deposit in Plumes county and has proably excited es much comment as any on this coast. The gold is mainly found at points or pockets, where the stringer of quertz nerrow to a mere seam. Freqnently at these narrow points, Mr. Light takes out from $500 to $700 per day, by simply crnshing the rotten quartz in a hand mortar. The quertz is all richly auriferoue and by careful reduction will pay largely. Light works hie mine alone and in his own rude way pecks out from $4,000 to $6,000 every year. He has dearly earned every dollar which he has realized, however, for the emount of hard work which he has expended upon the claim is enormoue. He hae literally honeycomhed hundreds of feet of tbe mountaiu witb ditches, open cuts, side cuts, shafts and tunnels, and is still delving away. Some years ago, this indomitable worker dug a ditch along the summit, above its present work, which, duiing the epring months, will carry e good streem of water. Strangely enongh, he does not think of utilizing this mighty power in dredging out his ground. The entire mess on botb sides of his ledge is rotten gneiss which could he readily removed by even a smell stream of water, rnd thereby save an enormoue amount of picking which the old man ie now doing. Besides, there are douhtless thonsends of dollers' worth of gold in the wash bclow the ledge. —*Plumas National.*

Develop your Mines.

The following sensihle remarks we find in the Merced *Independent;* they are applicable wherever mining is carried on.

We believe a new era in quartz mining is dawning. Men who own lodes have come to the conclusion that they would know beyond a reasonable doubt whether their property wes valueble or not. Years of waiting for capitelists to come and purchase, at extravagant prices, a mere hole in the ground, has convinced many thet it ie useless to expect a fortune in that direction. They have, therefore, begun to work in eernest, and there is no doubt that they will keep np their good resolves until they heve fairly tested the true character of their claims. With few exceptions, from five to twenty feet is the extent of excavetions on our lodes, and no one who has the leest knowledge of mining is insane enough to believe that he can tell anything about a lode with snch development, nor can it be expected that capitalists will purchase such property. Men who have money to invest in mines at the present day want to know what they are spending their money for. Some few may be willing to squander a few dollars in the hope of making a "strike," but they are not numerous. They have heen deceived too often in that way. Those miners who have no money to spare in developing their mines can do much with their own hands. The placer mining season is well nigh over, and they will have from now until next spring to devote to quartz operations. It will cost them no more to live while at work than it would if they were idle, and in most instances not as much. The cost of tools, etc., will not be great, and the work performed may insure each a fortune. In most cases two men can sink a small shaft to a depth of fifty feet during the coming winter, and as much more the succseding one. A lods at the depth of one hundred feet may bs considered sufficiently developed to know something of its character, and if good, can bs sold for a fair figure, while the cost to the owners, if worked in the manner described, would be inconsidsrable. Besides, in many cases, a sufficient quantity of paying ore will be taken out to defray a good portion of the expeneo.

Chinese Miners.

The Oroville *Mercury* in an article on this snbject says: About a mile outside of Oroville lie the late snrface diggings, which were principally opened by Cbinamen a short time ago, and which it is strange to conccive beve not been long before now worked by white men. We visited the scene of operation lest week, and found a country covered with manzanita and chapperel and hushes over a distence of country about three miles broed hy six miles long. The country where the diggings are located is rolling land of rich loose soil, favorable lookiug for egriculturel qualities as well as minerel. All along the road on eitber side can be seen nothing bnt brush and rough lumber and shake shanties, in size twelve by thirty feet, and shafts and drifts with rough and ancient looking windlasses, rockers, pans, pumps, end otber tools and equipments incident to digging in this class. All the tools and fixtures used ere old, and none of the more improved and scientific ere to be seen in use. For example, they do not even use our etyle of forge bellows, but have a most ingenious and cheap snbstitnte in the form of an oblong box, ebout three feet long, which is mede on the same principle as a steem-chest, and in the box is a piston rod, which, by pulling out end pushing back again, ejects a blest of wind through a rude looking iron nozzle, the whole worked hy two valves on either end of the box. There is bnt one white hlacksmith among ebout four to six thousend of these mining Celestiels, and the other forges are run entirely by the Chinese themselves, They do not use our iron anvils, but as a substitute a species of bleck granite stone, a large flet piece of which they forge end point their picks on, and when tbe stone is broken they substitute a new one and so on, thus seving the expense of an anvil.

They are primitive in all their workinge around tbe shaft, and carry out or imitate the ideas of the California miner over tweuty years ago. We sew one fellow wesbing his sbirt and pents, hanging them upon some tailings to dry, and going round clad in his hoots until they were dry enough to wear. It is indeed singular thet with ell their awkwardness and ignorance of miniug, they cen make such wages as they are certainly doing. We helieve thet if white men hed these mines to develop instead of Chinemen, witb their superior intelligence as practical miners and improved tools and machinery, they could meke more money out of them, and consequently enrich and populate our town and country. Why these claims have lain so long undeveloped seems a myetery, and why white miners of California cannot at present be induced to locate and make money out of them appears just as strange.

Natural Gas.

It is interesting to note the extensive utilization made in various perts of the United States of inflammeble gases which, in certain localities, issue from the eertb in almost incredible volume. From a recent article by Prof. J. S. Newberry, we learn tbat the ges which issues from the salt wells of the Kanaweh Velley has heen for yeers employed es a fuel in the evaporetion of the brine. The town of Fredonia, N. Y., has for more then 40 years been fully or partially lighted by gas whicb issues from springs et that place. In numerous borings made for oil in the West, ges hae been met with in abundance, and was regarded formerly as a useless and inconvenient product. Witbin the past few years, however, tho gas has been largely utilized, and borings have even been mede with the express desigu of obtaining it. In some cases these gas wells heve been highly productive, furnishing an abundence of material for heating and lighting in a most convenient end manageable form. As noteworthy occurrences in this connection, the article in question statee that on tbe Upper Cumberlend, in Kentucky, gas accumnlates in ench quantities beneeth the streta of lower silurian limestone, thet many hundred tons of rock and eartb are sometimes blown out with great violence. The explosions have received the local name of "gas volcanoes." In Ohio gas escapes from nearly all the wells bored for oil in the oil producing districts. One well, in Knox county of that State, has for five years continued to send forth a constant stream of gas, of such enormous volume that when ignited it forms a jet of flame 3 feet in diameter and 15 feet long. Another neighboring well, in West Bloomfield, delivering, according to Professor Wnrtz, about 15 cubic feet per secoud, will probably shortly be utilized to supply, for industrial purposes, the city of Rochester, some 20 miles distant. At Erie, Pa., there are now 25 wells in successful operation, most of which have been bored for the express purpose of obtaining gas. For illuminating purpoees this natural product seems to be much inferrior to that furnished in cities and towns, ranging about seven or eigbt candles; its chief application has thus far been for heating pnrposes, for which it seems eminently qualified. Upon removing by simple means some of the ingredients which diminish its illumineting quelitiss (carbonic acid, etc.), its value as a lighting agent is greatly incrsased *Iron Age.*

Caribou District.

From Dr. Cess, a keen observer, who hes just returned from Caribon District, we bavs gleaned the following interesting information: The information ie of double interest to our readers, not simply because Caribou is a wealtb-producing district, but that Corinne is its outlet, and the precious dust, as fast as unearthed, ie sent here, where the major part is converted into goods and necesseries. The District is situatsd in Idaho, ahout 140 miles distant. It is made up of four principal gulches, whicb all head in Bald Mountain, a prominent peak which looms np 13,000 feet above the sea levsl. Streems formed by the melting enow cleave tbs mountein in four parts, and furnish the motivs power for exceveting the precione metal. Tbe fell of these streams is eo great thet hydraulic mining at any place is practicable. The gravsl, which lies fifteen to twenty feet in depth, on tbe hed rock, all contains more or less gold. Wbers hydraulice are nsed, the average yield per day is $20 to the man, and wbere simply the shovel and sluice-box are used, $3 to $5 per dey to the man is the aggregate prodnction. At present about 100 men are operating in the district, though we deem it safe to say thet five thousand men could find remunerative employment there for et least five yeere to come. As one approaches the mountain the bed rock naturally lies deeper from the snrface. though at tbe ber it ie not too fer down to be worked to advantege. The only gold found in the country is in these streams, and ae tbe summit ie approached the gold seems to increase, not only in quantity but richness. With these facts in view it does not require an over-ecute comprehension to see thet Bald Mountain is tbe grand fountein head wbich supplies Sneke river, and McCoy, Iowa, Bilk, Last Chance and other gulches which form its tributaries. The large nuggete found at the eource are naturally disintegrated by tbe powerful force whicb carried them down to lower streams, which readily accounts for the finer dust found in the washings on Sneke river. The naturel edvantrgee of tbe district are many. In each of the four gulebes mentioned there is a sufficient heed of water for extensive hydraulic mining, which is sweet, cold and limpid, and admirably calcnleted for domestic use. There is an abundance of timber near, end tbe eccess is moet easy—so much so that a light pleasure buggy is all that is neccessary to meke the trip from here to there, Keenan City, a small town, ie situated near tbs mines, and eight miles distant is enother village where the miner can ohtain the every-day necessaries. It eems thet the boye at Cerihou considered they had a good thing end aimed to keep it as quiet as possible, yet it ie but due to the general public that a district with sucb natural edventeges, and of so much intrinsic wealth should he known to them. An eetimete of the fineness of the gold dust can be formed when it is known that tbe $5,000 purchesed by the Doctor went 9.60.—*Corinne Reporter.*

Gold Mining in Australia.

From the statietics of tbe Government dspartment of mines, it appears that there were 52,965 miners in the colony in 1872, of whom 36,141 wero engaged in alluvial mining, and 16,824 in quartz mining. The quantity of gold reised in 1872 wes estimated et 1,331,377 oz. The earnings of alluvial miners during the year, were computed et £95 0s. 6¾d.; of quartz miners et £159 0s. 6¾d., reckoning according to the amount of gold obtained; and the average earnings of each man when the gold was divided amongst the 52,965 was £93 6s. The number of distinct auriferous quartz reefs worked or prospected at the end of 1872 was 3,224, and the total area of the ellnviel and quartz ground which hed been actnelly opened up was 1,026 square miles. The valne of the gold and othcr metels and minerals raised in the colony from the first discovery of tbe gold fields to the 31st of December, 1872, is eetimated by the department at £168,566,033, which is made up principelly from gold, silver, tin, copper and antimony, es follows: Gold, £168,149,305; silver, £5,281; tin, £282,105; copper, £5,810; and antimony, £77,237.—*Melbourne Argus.*

THE product of Alabame coal fields is estimeted at 32,250,000 tons, enough for two thonsend years' consumption of tbe whole world ! Alabema, according to Mr. Cridland, British Consul, shonld produce ten millions of coal per annnm, employing at least one hundred thousand men. And then by the coal beds is an inexhaustible supply of iron, also near the surface. The eaey access to tbe Alabama iron, the immediate proximity of the coal and irou, the good quality of the coal, tbe proximity of limstone used iu reducing some descriptions of ore, the abundance of water power, tbe healthfulness of the country—free from ice, enow, or volcanic eruptions, of timber, etc., all tend to prove the immense value of these mineral regions.

PROF. AGASSIZ hae increased the known fishes of the Amazon from 150 epecies, to 3,000. He says: Some species carried their eggs in their mouth, some carried their yonng in a large fold depending from the lower jaw; some, aftsr casting their eggs, hovered close above them, the agitation of air produced hy their breathing contributing to haeten the process of batcbing.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufactnrers aod have constantly on hand

SPORTING,

MINING,

And BLA-TING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE aod the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tuuuel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and ecouomy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tuuncling, Shafting, Open Cut or Quarrying, and will drill six to ten luches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Oothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Onte Tnnnel, L. I.
Mess. Shanley.....Hoosac Tnnnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Po.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Roebling .....East River Bridge Company, N. Y.

☞ BUY BARBER'S BIT BRACE. ☜

[Continued from Page 197.]

ARIZONA AND UTAH. — Sinking the eest incline is progressing at the rate of 2 ft. per day. Some bunchee of fine ore heve been enconnter d, and the prospecte for finding paying bodiee are excellent. There is not sufficient water to interfere with or impede the sinking. At the depth of 400 ft. a station has been opened and a drift started to tap the ledge, which, it is expected, will be accomplieshed in a very few days, when eome good develop'ments may be looked for.

OPHIR.—The south drift at the 1300-ft. level is still driven ahead with excelleut indications of the development of a fine body of good ore. A cross-cut east from the south drift on the 1465-ft. level, will be started in a very short time, when eome good developments may eoon be looked for. The main west drift, on the 1700-ft. level has reached the west wall, and a south drift been commenced.

JULIA.—The flow of water into the shaft ie elowly, though eteadily, decreasing, there being only 75 ft. of water now above the 1,000-ft. station. A drift has been eterted in a eoutherly direction 100-ft. above the point where ore wae encoustered on the 1,000-ft. level, at the time work was euspened on account of the heavy flow of water.

HALE ANN NORCROSS.—Daily yield, 65 tons of ore, mostly from the eecond and eleventh etation levels. Sinking the main incline is making eteady progress, the rock in the bottom blasting quite hard. The varioue prospecting drifts on the different levels are making fair progress with nothing of interest to report.

JUSTICE.—The main drifts both north and eouth, at the 250-foot level of the Waller Defeat Shaft are still driven ahead without change of interest to report. The eouth drift, 400-foot level of the Justice shaft, is making good progrese. The north drift at the 300-foot level, is still in good ore.

DAYTON.—The dump contains 400 tone of ore awaiting reduction whenever mille can be obtained to crush it. The main west drift at the 310-foot level tepped the ledge ou Thureday last, which is very compact, and showe finely at that point. No water of coneequence hae been met to impede the work.

CHOLAR POTOSI.—Daily yield 140 tons of ore from the ore breaets and workings of the old upper levels. All the ore producing eections of the mine are looking and yielding finely. The cross-cute and proepecting drifts at the fourth etation have developed nothing of valne during the week.

SIERRA NEVADA.—Thie mine continues to yield the nsual amount of good ore, keeping the mill steadily running. The ore hreaets are being gradually extended further to the north and west, the quality of ore showing considerable improvement.

SAVAGE.—Sinking the incline ie making good progress, the rock in the bottom working finely. The several prospecting drifts and cross-cuts on the different levels have developed nothing of material value during the week.

BALTIMORE CONSOLIMATEN. — Work at all points in the mine ie making excellent progress, and the proepecte and indicatioue of the development of a good paying mine, in a very short time, are growing better every day.

DANEY.—The new pumping machinery wae all completed, and draining the shaft of water commenced yesterday. Sinking the shaft will be resumed ae soon ae the supply of water ie exhausted.

OVERMAN. — Sinking the ehaft is making steady progress. The main weet, southweet and uortheast drifts are all being steadily and vigorously driven ahead without change of interest to report.

IMPERIAL.—Work in the mine is progressing ae usual, with nothing new to report. The annnal meeting of the stockholdere will be held in San Francisco on Thureday, September 26th, at one o'clock.

AMERICAN FLAT.—Prospecting through the lower level of the Baltimore Consolidated continnes with nnabated vigor, the indications of the development of rich bodies of ore steadily increaéing.

TYLER.—The main ehaft ie down 165 ft., the einking averaging about 2 ft. per day. The rock in the bottom works well and there is a slight increase of water.

KNICKERNOCKER.—There is little or no change to report of this mine, with the exception of good progress made by both the main west drift, and the sonth cross-cut.

KENTUOK.—Nothing doing on the lower levele of the mine. An assessment of $1 per ehare was levied on the 16th inetant, aggregating $30,000.

UTAH.—Sinking the ehaft is making excellent progress, the rock working well, and the pump draiuing the water with perfect ease.

Colorado.

CENEVA DISTRICT.

THE CONGRESS LONE.—The main or discovery shaft ie 30 ft. deep, and is timbered with good, substantial cribbing, ahout one-half the depth in the ehaft. On the hangiug wall the ore vein is 8 inchee, and on the foot wall 4 inches wide, making 12 inches of solid galena aud gray copper ore, that aesaye from 365 to 415 ounces per ton. Comfortable buildings have been erected over the mine and a dwelling house for the miners. Preparations are being made for working the entire winter.

THE REVENUE LONE, owned by Milner & Callory, ie being worked uuder a lease hy Thompson & Love. The diecovery ehaft, now 44 ft. in depth, has paid for sinking. East of the discovery another shaft hae disclosed a very fine vein of gray copper, 12 inches in width. This lode has been opened at intervals of 30 and 50 ft., for a distance of 400 ft., showing a elrong vein et eech opening ; 17 men are employed. The daily product of thie mine ie 2⅗ tons, worth at the mills in Georgetown 300 ounces per ton, which yields the leeeeee a handeome profit.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SOIENTIFIO PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., September 23d, 1873.

FOR WEEK ENDING SEPTEMBER 9TH, 1873.*

KETTLE ANN PAN SCRAPER.—Emma J. Whitman, Oakl nd, Cal.

ORE CONCENTRATOR.—John A. Peer, Grass Valley, Cal.

ORE WASHER.—John A. Peer, Grass Valley, Cal.

RECIPROCATING ENGINE.—Albert Staley, S. F., Cal.

——*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

THE CALIFORNIA OLEOMARGARINE MANUFACTURING CO.—Sept. 20: Capital stock $300,000, in 3,000 shares of $100 each. Directors—West Evans, Vernon Seaman, Frank A. Davis, James T. Dean, Cyrus T. Wheeler, Charles Miller, Charles G. Athearn. The object of the company is to manufacture olcomargarine from fresh suet, and the products from the suet, after the oleomargarine has been extrscted from it, and the marketable products from the oleomargarine, and to acquire such materials and property necessary to carry on such business and to sell and dispose of the same.

WALLAPAI M. AND M. CO.—Sept. 20: Located in Wallapai Mining District, Territory of Arizona. Directors—Hill Beachy, B. W. Mudge, John F. Boyd, Robert R. Givens and Isaac N. Thorn. Capital stock, $1,000,000, in shares of $100 each.

TALISMAN M. CO.—Sept. 24. Location: Middle Bar Mining District, Calaveras County. Directors—J. D. Fry, A. K. P. Harmon, R. F. Morrow, J. W. Gasbwiler and E. J. Coleman. Capital stock, $2,000,000.

VEGETABLE SLICER.—The State Fair *Gazette* eays: B. Essig ehowe a California invention. It is a vegetable slicer, consieting of a revolving bottom to a small vessel which carriee a knife. The vegetable is held against projective, and pressed upon the bottom. The other hand turns a crank, which revolves the bottom. The eame power turns a small grindstone for knivee, and a coffee mill attachment. It ie a really nseful machine for the kitchen. He also ehowe a new joiut for uniting timbere, and a new etyle of extension compass. He exhibits, also, a double-acting press and hoisting machine, which consiets of a heavy perpendicular ehaft, attached to a circular plate, the under face of which has two circular inclined planee. A plate corresponding to thie rests on a cross-bar beneath. A pivoted bar has wheels above and below between theee platee, and running on the inclined planee, when, hy levers, the pivoted bar is turned, the wheels run up the inclines, and the ehaft ie forced npward. When the incline hight is accomplished, the ehaft is wedged up by side notches and a key, and the lower plate and bar elevated and held by catchee in an upright frame till the wheels again apply and a new lift is made. Mr. Essig cau be found at the Sacrameuto Foundry. [Since the above item was printed in the *Gazette*, we notice that a diploma hae been recommended for the double-acting hoieting machine.—EDITORS PRESS.]

TIRE REGULATOR.—One of the Sacramento papers thus describes a tire regulator exhibited at the State Fair: W. W. Bolton exhibits one Kafider tire regnlator. Thie is a simple and useful invention, to which we invite attention. In the felloe of the wheel a pyramidal wedge, in two equal parts, is inserted, cutting the felloe in two. The inner face of each part of the wedge has a emall friction roller. A bolt rune between the wedge parts and has a wedge head. A nut is on the outer end. The whole device is held to place by a brass or iron cap flush with the felloe, the nnt of the bolt being outside. Now when the wood shrinks and the tire is ready to fall off, give the nut a turn; the wedge head is drawn down between the two parts of the divided pyramidal wedge, and moves on the rollers, which, being parted, push aside the felloe and fill up the tire. Of course two of these machines are needed in every wheel, so that the epring required may be divided between the two halves of the wheel. The apparatus works to a charm, is a neeful one, and eavee the expense of resetting tires.

PAYING.—The *Mountain Messenger* says: "Col Baker has taken ont $50,000 from his claim at Gardner'e Point, near Grass Flat. Two years ago he paid $43,000 for the mine and ditch. This ie but one of many euch chancee in this county in hydraulic mining, really the safest kind of mining."

TO THE PUBLIC.

THE PAIN-KILLER manufactured by PERRY DAVIS & SON has wen for itself a reputation unsurpaesed in medicinal preparations. *The universality of the demand* for the Pain-Killer is a novel, interesting and surprising feature in the history of this medicine. The Pain-Killer is now regularly sold in large and *steadily increasing* quantities, not only to general agents in every State and Territory of the Union, and every Province in Britisb America, but to Buenos Ayres, Brazil, Uruguay, Peru, Chile, and other South Amcrican States, to the Sandwich Ielands, to Cuba and other West India Islands; to England and Continental Europe; to Mozambique, Madagascar, Zanzibar, and other African lands; to Australia, and Calcutta, Rangoon and other places in India. It has also been sent to China, and we doubt if there is any foreign port or any inland city in Africa or Asia, which is frequented by American and European missionaries, travelers or traders, into wbich the Pain-Killer bas not been introduced.

The extent of its usefulness is another great feature of this remarkable medicine. It is not only the best thing ever known, as everybody will confess, for bruises, cuts, burns, etc., but for dysentery or cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of British India and tbe West India Islands and other hot climates, it has become the *standard medicine* for all such complaints, as well as dyspepsia, liver complaint, and other kindred disorders. For coughs and colds, canker, asthma and rheumatic difficulties, it has been proved by the most abundant and convincing trials and testimony to he an invaluable medicine. The proprietors are in possession of letters from persons of the bigbest cbaracter and responsibility, testifying in unequivocal terms to tbe cures effected and the satisfactory results produced, in an endless variety of cases, by tbe use of this great medicine. That tbe Pain-Killer is deserving of all its proprietors claim for it is amply proved by the unparalleled popularity it has attained. It is a *sure* and *effective* remedy. It is sold in almost every country in tbe world and is becoming more and more popular every year. Its healing properties have been fully tested all over the world, and it need only to be known to be prized.

Sold by all Druggists. sep13

THE friends of Dr. Paul M. Brenan, the apicy lecturer, will be pleased to see, from his card in our advertising columns, that he bas opened an office in this city. *

NOTHING ELSE WILL ANSWER!—If you are hoarse, have a cold, or a hard cough, ask your druggist for *Hale's Honey of Horehound and Tar*. Take nothing else. It is the one sovereign remedy for all complaints of the throat and lungs. Crittenden's, 7 6th Avenue. Sold by all Druggists.

Pike'e Toothache Drope cure in 1 minute. *

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSORANCE Co. J. B Roberts, 315 California Street, San Francieco, is general agent for this Coast. Send to him for circulare and information of thie reliable, first-clase company.

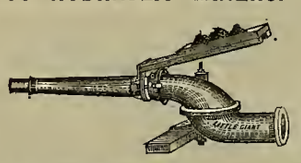
Machinery.

TO HYDRAULIC MINERS.



I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliences, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

This Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not went to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.

Dutch Flat, August 1, 1873. 6v27-2m

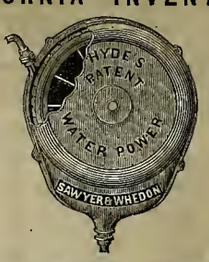
CALIFORNIA INVENTION.

CALL AND EXAMINE.



For Sewing Machines, Dentists' and Jewelers' Lathes.

This Invention can be applied to the operating of all kinds of Sewing Machines, Dentists' and Jewelers' Lathes. Its simplicity is only equaled by its durability; it avoids the use of the treadle, which is ungraceful and injurious.

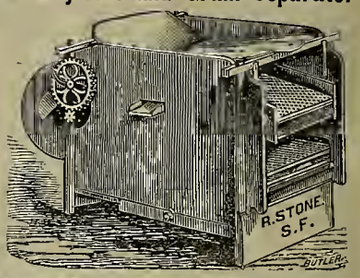
Application made by the Agents for the Pacific Coast.

SAWYER & WHEDON,

1v6eowbp 633 Washington street San Francisco.

THE PATENT

Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

R. STONE,

3v6-3m-sowbp 422 Battery street, San Francisco.

Parshall's Lubricator for Steam Engines.

These Lubricators are suited to all steam Engines, delivering the lubricant, whether tallow or oil, to every kind equally well. They are subject to be placed in the steam pipe, steam chest cover or the cylinder head, as is desirable. They admit the steam freely to the lubricant, which is constantly saturated with it and kept thereby in a free liquid state. When condensation of the steam begins, the water settles below and raises the oil to the top. The oil is fed from the top of the cup, through a tube which passes down through its center. All sediment in the oil settles to the bottom of the cup, and the oil, on going to feed the engine, is always pure. By simply turning a screw in the top of the cup, the flow of oil is regulated to suit the requirements.

We have numerous testimonials from Railroad Engineers and others, speaking in the highest terms of their superiority. The first one put in use on this coast is at the Pacific Saw Manufactory in this city. Parties desiring further information will please send for descriptive circular and price list, or call at our office.

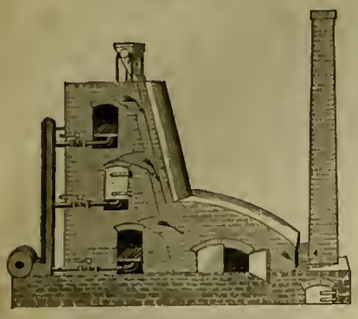
Metallurgy and Ores.

EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street,

San Francisco

Important to Miners and Mill Men.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companiss, Civil Engineers, Contractors, Etc.

The system of transporting material, such ae Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by meane of steel wire rope, has been well tested and found **more economical, advantageous and reliable** than any other method of transportation; and to the annexed certificatee in connection therewith I heg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it givee me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up hy you upon our mine in Freihurg.

It is a perfect success, discharging ten tons of ora per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear ont. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if deelred. After several weeks trial npon our mine, the unanimous verdict of all who have acen it is a complete, nnquestioncd succees. If this can be of any service to you, nse it in any way you think proper. Very respectfully, C. C. GOODWIN,

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, OCTOBER 4, 1873.

VOLUME XXVII. Number 14.

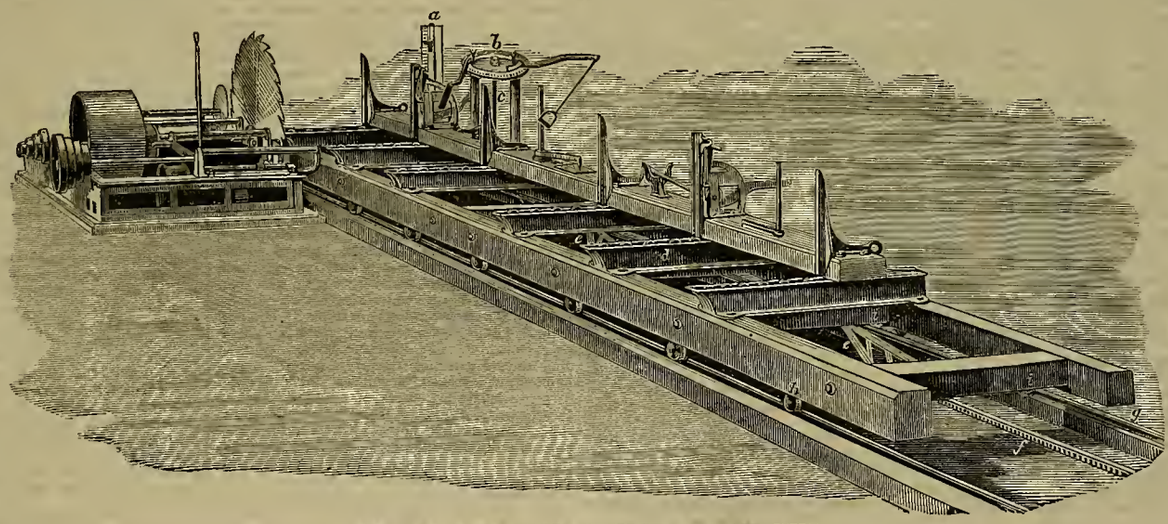
The "Ne Plus Ultra" Circular Saw Mill.

We illustrate this week ons of Ely's patent circnlar saws. The "Ne Plus Ultra" is quite well knowu in the Eastern States, and has heen snccessfnlly intrudncd in the English Provinces and Sonth America. Tho medal of spccial award was given it at the lato Exhibition of the American Institute, in New York, with the following comment:

"It is a machino worthy the highest praise. It is positive in actiou, rapid in movement, and perfectly accurate in resnlts, while it oombines an improved friction feed, a new guide or log roll for springy timber, and is constructed on the principle of the inclined plane, which is admirably applied."

The cut is designed to represent a Number III or IV Saw Mill ready for nse. Letter *a* is the scale or measure, heing in front of the sawyer, who can see at a glance the thickness of the lumher heing cut; *b* represents the lever and gear connecting the shaft, c, with the pinion which moves the inclined planes, *e*, which are connected hy shoes on the headblocks, *d*, with the log heam. These inclined planes are connected hy iron rods, so that all move exactly alike, thus securing perfection in the movement of the log beam, and may he made any length rsquired. *f* is the rack stick, which is placed at the center of weight on the carriage. *g* is the guide strick, which is a strong stick of timber firmly fastened to the sills of the hnilding, running the entire length of the carriage track, and lined on hoth sides with iron, and made perfectly straight so that the guide rolls, *i*, fastened to the girts of the carriage, prevent any deviation from a straight line of the carriage, thus making the lumber perfect in thickness from one end to the other; *h* is a 7-inch roll, with a 2-inch face firmly fastened to the carriage with self-oiling hoxes, and running on a plsin iron track. For the purpose of sawing long and heavy logs of timher, are inserted anti-friction rollers in the headblocks, *d*, which carry the log or timher and log beam with so much ease, that the sawyer can easily move the heaviest log with no strain on the machinery. The latest improvements in dogs, spring and set-out hlocks are used, which we cannot show in a cnt. The saw mandrel is of the best steel with self-adjusting and oiling hoxes, and a new and improved friction feed. A decided improvement, not shown in the cut, has heen made, placing the inclined planes on top of the headblocks.

The "Ne Plus Ultra" saws are made hy F. C. Candee & Co., No. 57 Liberty street, New York, to whom we refer those desiring further information. The mannfacturers advise us that they have put up single saws which are cutting 40,000 feet of lumber per day of ten hours, and that all of the Ely machines are reported as working very successfnlly.



THE "NE PLUS ULTRA" CIRCULAR SAW MILL.

Removing Officers of Mining Companies.

Ths majority of the owners of ths Minnesota Gold and Silver Miue have filed a petition in the Connty Conrt, praying the issue of a notics for a mseting of the stockholders of the company, to tske into cousideration the removal of the officsrs of ths company. The petition has heen granted hy Jndge Stanly and the meeting is called for the 4th of Octoher. The anthority for this proceeding is fonnd in the Act of March 21st, 1872, entitled an Act supplemental to an Act concerning Corporations, passed April 22d, 1852.

The first section of this Act (published in the PRESS January 4th, 1873,) provides that a majority of the stockholders of any mining corporatiou may petition the Connty Judge in the county in which the corporation has its principal office, and that he shall, upon such petition heing duly signed and presented, call a mesting, stating it to he for the purpose of taking into consideration the removal of officers of the company. The Act then goes on to state that at the appointed time and place the shareholders shall assemble, appoint a Chairmsn and Secretary and prove their right to vote. If it appears that at the time appointed, or within one hour thereafter, shareholders of less than one-half the stock are present no further proceedings shall he held and the meeting shall he *ipse facto* dissolved; *provided* however, that by a vote of the holders of two-thirds of the capital stock of the corporation, the hoard of Trustees may he reqnired to furnish to the meeting a written, detailed statement and account of the affairs, hnsiness and property of the corporation; bnt, if the holders of more than two-thirds of the shares are present, they shall proceed to vote, the Secretary calliug the roll, and the memhers voting 'Aye' or 'No,' as the case may he. The Secretary adds up the list, hands the ssme to the Chairman, who annonnces the result.

If the result is that if the holders of a majority of all the shares of the company are in favor of the removal of one or more of the officers of the company, the meeting then proceeds to ballot for officers to snpply the vacanciss thus creatcd. A report of the proceedings must he handed to the County Judge, who shall thereupon issue to esch person chosen, a certificate of his election and also issue an order requiring that all books, papers and all property and effects he immedistely delivered to the officsrs elect. Ths officers thns elected are to hold office nntil the next regular annnsl meeting unless removed nnder the provisions of this Act.

This Act is a very good thing for stockholders, as officers can he held in check, whereas formerly they had their own way. It is to be presumed that no snch extreme measures wonld be taken unless in case of necessity. We do not know any of the circnmstances of this particnlar csse, hut the holders of 11,275 shares ont of 20,000 shsres, signed the petition. If officers do not do thsir dnty, either by negligence or dishonesty, they ought to he snmmarily removed; and it is fortnnate that there is a means of doing so. It is more owing to mining Trustees that mining is considered a speculation rather than an investment, than anything else. A good msny of these people think, like ward politicians, that all that is required of them while in office, is to make as much as possible, no matter how, and they improve their opportnnity. Again, men get into these positions, who hy masterly inactivity hother those who really want to make money until the latter have to sell ont. We have not had very many examples since this law was passed, hut one every few months is enongh to remind incompetent or dishonest officials that they mnst be careful in their operations and not go too far.

CHINA AND JAPAN.—It is reported hy an officer of the United States Navy, lately arrived from Japan, that an English compsny has completed arrangements and will, at au early day, establish a line of steamers to run between San Francisco, China and Japan. The English company will adopt full-rigged propellers, and promise to make the run in 17 days.

THE ore shipments from Alta City, Utah, last week, were as follows: Flagstaff, 60 tons; Davenport, 80; Wellington, 8; Windsor Group, 8; Highland Chief, 5 tons per day; Emma, 105; Vallejo, 80; Toledo Company, 25; McKay, 26; Oxford and Geneva, 70 tons for the week.

THE Grass Valley mines are all tnruiug out splendidly. The Eureka mill was cleaned up on the 26th nlt., after six days run with 15 stamps, and the yield was $10,500.

Silver Bars.

The financial depression in New York has had some effect in the prices of silver hars, and this week the hankers that purchassd wanted an extreme rate of discount—12 per cent. The average rate for some months past has heen ahout two and a half or three per cent. In fact the banks dsclined to purchase silver hars at all nnless they had been contracted for in advance, and such companies as had not made any arrangements of the kind have placed their bars on special deposit. A correspondent of the *Chronicle* addresses that papor on the subject of the depreciation of silver and its canse, inclosing a letter dated New York, Septemher 1st, from one of the leading bullion hankers of that city, who is regarded as authority on the snhject whereof he writes. He says:

If it can he of any service to you, yon can say to Mr. ——— that I advised Mr. ——— on Friday last to telegraph him to enter into no coutract for silver. I was in receipt of information from the other side of a material decline, and, what was worse, of the strong probability that the Bank of France as well as other institutions, public and private, may be obliged to decline to receive silver as *collateral for gold*. There is a great plethora of silver on the continent, (Holland heing choked with it to the detriment of trade), while there is a general tendency to get on to an exclusive gold basis. *If this can be done* by Germany and Holland, it would demarketise nearly $400,000,000 of silver. These Governments, however, *must* make this change slowly, or it will distress and annoy their people. Still, they mesn to do it, and will do it. So that unless the demand from the East increases very mnch over the last few years, silver will rule low. We are buying fine silver bars now at 126¼ per onnce—an unprecedentsd rate, so far as my experience goes.

Notwithstanding these views it is hardly prohahle that our silver mines will be closed hecause of the decline in silver. Bars will prohahly resume their former value as soon as the financial storm in New York is fairly over. It is impossihle to depose silver from the position it holds in the commercial world. It is not only largely used in manufactures, bnt when we hear of people in the world who are working hard every day for a few copper coins, there is little chance of silver going out of date as a material for coiuage. The Eastern nations all prefer silver to gold. The cause of the snddeu change in rate of disconnt is of course fouud in the financial depressions in the East, and the necessity of the banks keeping a plentiful supply of coin on hand to prevent accidents.

THE Bullionville Railroad carries ore from the Raymond & Ely mine to the mills for $3.50 per ton, whereas the teamsters charge $5.50 per ton.

STEAM FIRE engines are to he introduced in Japan.

CORRESPONDENCE.

Quicksilver Extraction.

Ens. PRESS:—The present wasteful and unsstisfactory method of treating cinnabar, demsnds an entire chsnge, more thsn hslf the mercnry in the ore being lost to commerce, and every ponnd so lost, is at the least a dollar out of the pockets of the owners. Why csnnot science he brought to hear upon this work as well as in the trestment of other ores? Large snms of money are annually expended on the erection of open vertical furnaces snd hrick condensers, which are absolntely wasted. The principle of allowing the flame, (particularly from the use of wood,) to come in contsct with the raw ore, (dropped into the furnsces in large lnmps,) is quite erroneous to start with. By this treatment the vapor passes with the sulphurous scid, resulting from the oxidatiou of the sulphnr, and unites with the soot and suhlimed vermilion, from the furnace, destroying in its passage any wood or iron it comes in contact witb, into the conduction pipes or condensers. The soot itself is very difficult to treat afterwards, even with the addition of lime or by hoiling, and all the labor so employed is a source of nnnecessary cost.

The heat employed to reach the center of the lumps, is in every case I have witnessed far too great; indeed, I have seen it as high as 2,000°, instesd of being under 700°, and a lsrge portion of the mercury so liberated is destroyed for any prsctical use before it enters the condenser, and the smount of fuel required is necessarily greater, and the time much longer thsn if the ore was pulverized. Again, the bricks being porous, *absorb* the metsl both in the furnaces and condensers, and no plan hitherto devised csn prevent this waste. Coating the condensers with cement is *not* a remedy, as any one conversant with the working can testify to; indeed the mercury can he seen exuding through the cement and bricks on the outside. In the New Almaden Works, I examined carefully the hricks of one of the large condensers lately pulled down, and out of about 100 hricks which I broke, scarcely one was not thickly permeated with metal, and in all the crevices of the mortar it poured out; neith r can they ever be rendered sufficiently cool.

Hitherto, the prevailing idea has been that spsce was the great desideratum for its condensation; this is an error; no matter how small the chamber, indeed the smaller the better, provided it is all kept *perfectly cold*. This is all that is needed. Cast iron condensers of great weight and of peculiar construction have been made, but the facility for fracturing this class of iron in transit, added to its great cost, renders the adaptation of wrought iron far preferable. In many of the works a fan has heeu connected to the coudenser to draw in the fumes from the furnace, with the intention of preventing a loss, and to create an unnatural draught. Why should this appliance be reqnired here any more than in the deposition of arsenic? Some of the adherents of this norel place, claim, I believe, to save 99¼ per cent. of metal. Such a percentage would indeed be a new era in metallurgy, for it was never yet obtained from any ore, nor could such hy any known possibility be so. How do they account for all the mercury that is found in their flues and stack, and on the surrounding grounds? I fear the friends of this theory never made any analysis of their workings, and as no assay made in the common retort can ever be exsct practically, it is mere moonshine to make a statement so opposed to all facts and truth. If the furnaces are properly erected, there is no need of any artificial draught; it would probably be more necessary to regulate the draught hy dampers.

In our works alone, out of 1,600 tons worked in this way, only an average of 8¼ *pounds per ton* was ohtained, where the ore treated contained by repeated assays from 20 *to* 80 *pounds per ton*. The loss was simply enormous. Another fact which is patent to everyone, is the waste of time and fuel reqnired in the making and treatment of adohes from the small or refuse ore; it is hardly conceivable at the present day that hand labor should he resorted to, or that an incressed hulk of material should he passed through the furnaos when economy of fuel lahor and money is as much needed here as in any other works. Here there is an open field for improvement. It has long been known that quicksilver may he most readily separated from its ore hy treatment with quick-lime. The sulphur of the cinnabar combines, by virtue of a superior affinity, with the lime, to the exclusion of the mercury, to form sulphides of lime and calcium, hoth of which remain while the mercury is volstilized by heat; and this is hest performed in retorts with a uniform heat. The retorts should be of cast instead of wrought iron, ae heing less liable to expansion or contraction, and ae the heat of the furnace is alwaye the same it does not become injured hy cooling ae the present system of furnaces do. In Bavaria, where retorts were first practically ueed, and still are, lahor and fuel are cheap, and emall quantities only were treated, but as those two items are of immense importance here, I have endeavored to adopt considerahle improvements, wherehy a very large quantity of ore can he daily treated with little fuel and a minimum of labor.

My plans emhrace 3 eets of furnaces, each set having 3 retorts 14 feet long, 4 feet wide at base and 2 feet 2 inches high at the center, and cast with two small rails running the entire length, upon which run 2 cars made of boiler iron 6 feet long and 11 inches high. The door slides in a groove snd is hermetically tight. Into each and all of these cars, the charge, amounting to one ton of crushed ore, is placed, after being intimately mixed with the requisite amount of quicklime and as soon as the retort is ready to receive them, they are run in from the platform on rails let down to the level of the retort. The ore then requires a *cherry red heat only* and should he completely finished in 6 hours. To enable the workmen to test the progress of the work, I have provided a stopper in the door, which he can take out and through it pass a copper rod and thus instantly test the presence of sny mercury, should it exist, so that he csn have no excuse to withdraw the charge before it is completely treated. When ready for dischsrge the door is lifted up by a weighted halance and rails placed from the retort on an inclined plane to run the cars direct to the dnmp. They are then relosded as before described. Thus there is no possibility of any salivation to the workmen. The mercurial fumes being now free from snlphur, pass out at the back end of the retort, through an 8 inch pipe into another pipe placed below the ground line, of 12 in. diameter, and running for 20 feet under water, nltimately discharging into the last condenser of boiler iron, also placed on an inclined plane. This condenser is kept nearly half full of cold water, which is always rnnning in and out. It is 12 feet long and 3 feet in diameter. The collected mercury runs now through a tube into a special reservoir, whence it can alwars be drawn out at any moment and bottled, without the least interruption to the work.

Every three retorts have a separate leading-pipe, into which the 3 conduction pipes are fitted, as also a separate condenser. These are surrounded by a hody of cold water, always running in at the bottom and out at the top. The depth of the water here is 7 feet. There is a stopper placed at the bend of each conductor, which can be taken out iustantly, to enahle the workmen to sweep the pipes when required. In the condensers there is an air-chamher, to create the necessary draught from the retort and prevent any water rushing back through the pipes. By this method the mercury is nearly all, if not entirely, condensed prior to its dischargè into the last condenser. The waste flame, of course, passes under snd over the retorts through the flues into the stsck.

As soon as the ore reaches the surface, I propose to crush it, cleaning it of superfluous gangue and clay, and then concentrate it. The cost of doing this is not one-quarter of the sum required for making adobes. I do not claim, tbst this plan which I am pstenting is so perfect that time and experience may not snggest improvements according to the necessities of the ores to he treated, but I do claim for it, economy of structure, perfect satisfsction in its continuous work, an impossibility of salivation, and economy in its manipulation, coupled with the certainty that whatever mercury there may be in the ore, it will be completly saved and its treatment rapid. I am not surprised that all the metallurgical authors of note describe the present method of treating cinnahar as "barharous in the extreme." These furnaces and condensers, *complete*, will cost under $13,000 and are capahle of treating 72 tons every 24 hours at an outside cost of $150 per ton at the present rste of wages and material. For the special erection of these furnaces, I was dispatched from New York on hehalf of a company here, hut owing to several delays, I doubt whether they will be erected this season. I ask hut a fair trial of these to prove their value over any others now iu nse. That the system of retorts is practically satisfactory is proved by the fact that they have heen employed in Bavaria since 1846, and are described hy the leading metallurgists hoth of England, France and Germany, as the most perfect apparatus invented. Those desirons of more information upon the suhject can see the plans at the Cosmopolitan Hotel, San Francisco.

HUBERT BANKERT, M. E.
Supt. Napa Q. M. Co.

MINING SUIT.—O. H. Conger and B. F. Dalton have instituted snit against D. C. Haskin, J. W. Haskin and the Emma Hill Consolidated Mining Company to compel them to issne and deliver to the plaintiffs 40,000 shares of the Emma Hill Consolidated, vslued at $20 per share, and restrain the defendents from transferring the stock to any but the plaintiffs. The latter claim the stock in accordance with an agreement hetween the Haskins and the Company, by which, in consideration of the transfer of certain valuahle mining property to the company, the latter agreed to transfer the 40,000 shares of stock. The plaintiffs allege that the Haskins acted as their agents, and it was their property that was transferred to the company.

VICTORIA NEEDLE.—A very curious needle is in the possession of Queen Victoria. It was made at the celebratsd needle factory of Redditch, and represents the columu of Trajan in miniature. This well-known Roman column is adorned with numerous scenee in sculpture, which immortalize Trajau's heroic actions in war. On this diminutive needle, scenes in the life of Queen Victoria are represented in relief hut so finely cut and so small that it requires a magnifying glass to see them. The Victoria needle can, moreover, be opened; it contains a number of needles of emaller size, which are equally adorned with scenes in relief.

Tin.

If there is any substsnce more thau another that has rendered England famous througout the world, it is tin. Camden, the historisn, supposes thst this country, from the abundance of tin that it contains, was called Britsin. In the Syriac language, "varacanac" signifies "land of tin;" whence is derived Britain. The mention of tin by Moses, in the 31st chapter of Numbers, 22d verse, is a proof of its being known from the most remote antiquity. Long before the Christisn era the trade of tin caused many a vessel to spread its sails in the Mediterranean ses, and to cross the Bay of Biscay to fetch it from these shores.

The alchemist of old considered tin to be a mixture of tin and lead, but modern chemistry proves it to be a distiuct metal. About 10,000 tons of tin are extracted every year from the mines in Cornwall and Devon, nearly the whole of which is consumed in the manufacture of tin plate ("fer blanc," or white iron, as the French term it.) that is sheet iron coated with tin; and it is this substance which constitutes our famous tin ware, which finds a market from Naples to Japan, from New York to Eupatoria. Melted tin forms a sort of varnish for iron, and prevents thst metal from rusting; whеu copper is coated with it verdigris cannot be produced.

Tin and lead melted together produce what is called "Britannia metal;" of which teapots and similar domestic utensils are made. It is owing to a mordant of tin that the dyer produces the fine scarlet cloth so famous as the roysl and military cloth of this country. In msny other ways we could show how very useful this tin is; but it is enough for us to state that England is the tin plate manufacturer of the world.—*English Paper.*

SPECULATING.—An "interviewer" of the New York *Herald* held a conversation with Commodore Vanderbilt, before that gentleman had received intelligence of the failure of Jay Cook & Co., and the other houses immediately following the announcement. In reply to the question, "What is the oause of the rottenness on Wsll street," the vetoran desler in stocks replied:

"I'll tell yon what's the matter—people nndertake to do ahout four times as much business as they can legitimately undertake. Of course, they soon get short, and have to bolster up their business as well as they can by robbing Peter to pay Paul."

Here is good sense. The lust of gain leads men from legitimate enterprises into speculations, which they hsve neither the means nor taleuts to carry to successful conclusions. Commercial and financial history ahounds with such cases. Individuals and corporations are alike guilty of the folly, which, in some instances, amounts to crime. The Commodore said further, which ie equally true, that "people who live too much on oredit generally get brought up with a round turn in the long run. The Wall street 'averages' ruin many a man there, and are like faro. Mistruet will be engendered till we, as a nation, do our business on a more solid basis, and pay as we go."—*Call.*

INVENTION OF PORTER.—Porter was invented in the year 1731 by a London brewer named Harwood, who combined the flavor of "half and half," or "three threads," as it was then called, in a heverage which he called "entire butt." The new combination took in the city among the "porters," and from its new patrons it obtained its name. Some antiquarians, however, declare that the honest liquor (honest, at least, in its youth) never derived its name from the porters of London, but, on the contrary, derived it from Harwood's practice of having his new beverage *portered*, or carried around to his customers' areas in shining pewter pots, in long covered racks, his pothoys shouting "porter" to announce their auspicious arrival, as they rat-tat-tatted at the door. More than a century this brown, mantling liqnor—thin, slightly watery, hut pleasant and heartening—has gone frothing up in the pewtor pots of London.

A STRANGE RIVER.—The Palatka (Florida) *Herald* says: "The St. John's River is very remarkahle. It is separated from the ocean throughout its entire length by a strip of land not over forty miles in width. Its banks are low, the soil, when examined, is found to contain very little silica, being composed mainly of minute shells. At elevated places along the banks the coquinea—a species of shell rock—can he seen. Wherever this is found the soil is fertile and particularly favorahle to the growth of the orange. Live oaks tower to the skies, and their hranches spreading some fifty or sixty reet each way, covered with a drapery of solemn moss, and cypress, hay, gum, palmetto and magnolia trees, with the beautifnl palm with crested crown standing like a sentinel along its shores, and orange trees bearing from five hundred to one thousand splendid oranges eaoh, make a man think that he is in the land of fable; yet this ie all sober fact."

MINE MANAGERS.—If only competent practioal men were appointed mining snperintendents stockholders would no doubt receive larger dividends. It is, however, evident that qualification is not always considered in making such appointments. The other day a new euperintendent on the Comstock lode inquired of one of the miners what "that long thiug" was, and added something to his stock of information on heing told that it was the pump rod!—*Chronicle.*

A Triumph of Art.

There is a paper church sctually existing near Bergen, which can contain nearly one thousand persons. It is circular within, octsgonal without. The relievos outside, and the statues within, the roof, the ceiling, the Corinthisn capitals, are all of papier-mache, rendered waterproof hy saturation in vitriol, lime-water, whey and white of egg. We have not reached this audscity ln onr use of psper, but it should hardly surprise us, inasmuch as we employ the ssme material in private houses, in steamboats, and in some puhlic buildings, instead of carved decorations snd plaster cornices. When Frederick the Second of Prnssia set up a limited papier-msche manufactory at Berlin, in 1766, he little thought that paper cathedrals might, in a centnry, spring out of his snuff-boxes by the slight-of-hand of advancing art. At present, we confess to a predilection for substancial brick and stone in the matter of churches. But there is no saying what we may come to. It is not very long since it would have seemed as impossible to cover eighteen acres of ground with glass, as to erect a psgoda of sosp-bubhles; yet the thing is done. When we think of a psalm sung by one thousand voices pealing through an edifice msde of old rags, and the universal element bound down to carry our messages with the speed of light, it would be presumptuous to say what can and what csnnot he achieved hy science and srt, under the training of steady old time.

HOME MADE WARES.—At the late Stste Fair, N. Clark & Co. exhibited specimens from the Pacific Pottery, Sacramento. These consist of a fine quality of fire, stove and furnace brick and linings, sewer and drain pipe of all eizes, stoneware, flower pots, urns, porous veesels of all kinds, hanging pots for flowers, tiles, pots, glazed wsre, jars, terra cotta work, crocks, jugs, etc., etc. Some of the finer specimens of pottery are painted, bronzed and embellished. Crude stone clay, from which the stoneware and terracotts is made, is on exhibition, and also crude fire clay. The *Record* states, at the factory there are employed fifteen men, directly, while an equal number sre engaged outside the works. The stone aud fire clay all comes from near Michigan Bsr. That it is a first-class quality is evidenced by the goods Clark & Co. make, which are of the very hest quality. The husiness is doubling itself every year, and the capacity of the Pacifio Pottery is fully taxed. Clark & Co. call especial attention to their make of fire brick. At least a quarter of a million dollsrs' worth of fire brick and clay is imported to this State annually, and all are interested in seeing a home competitive industry in this line huilt up. Fire brick is made by grinding the crude fire clay; it is then molded and burued; next it is broken up and crushed beneath stamps. It is now prepared with enough crude clay to hold it together, when it is sgain molded, pressed and burned. It will be seen why fire brick is not a cheap article. We are pleased to learn that the potteries of California, and especially that of Clark & Co., are yearly gaining ground against the imported fire brick and stone ware, and that as to the last class of goods the English make has heen driven from the California market hy the home product.

SOUTHERN UTAH, says the Beaver *Enterprise*, has mountains of crude iron, and deposits of coal so vast and scattered over so great an extent of territory as to insure a certain supply to the world for ages to come. Easy of extraction, unequsled in quality, as can be easily proved to any expert who may wish to test it, how long will it lie unheeded? Beaver, Iron aud Washington counties possess minerals in quantities to enrich the world, and coal sufficient to supply twenty worlds; yet there they lie awaiting patiently the advent of capital and hrain. Will it come? We are as positive that it will as we are of the unexampled success of those who take the initiative in this importsnt adventure.

DEEP WELL.—At the village of Sperenberg, about twenty miles from Berlin, a well hae been sunk to the depth of 4,194 feet. A shaft wss sunk in this locality hecanse the known existence of gypsum there led the explorers to infer that they might possibly find a mine of rock salt. At the depth of 280 feet they did resch the salt; and continuing on, they passed through the salt deposit—3,907 feet—without having reached the bottom of it. The horing would have continued, to ascertain what deposit lay under the salt, but the mechanical difficulties were too great. The greater part of the boring was done by steam.

THE EFFECT OF CONTINUED STRAIN.—A strip of wood or a rope, which will hear for a short time a heavy weight, will often hreak with a mnch smaller weight, if it be suhjected to the strain for a considerable period. A rope that will hear successive strains repeatedly, without breaking, will sometimes hreak with the same strain, if snhjected to it for a long time continuously. It is only possible to theorize upon the cause of this phenomenon, which can, in the present etate of science, only he referred to the hypothesie that matter exists in a molecular condition, with interstices between the molecules.

IT is estimated that one-tenth of the entire population of the United States ie dependent for support upon the prodnction and manufacture of iron. The value of the metal annually manufactured is $900,000,000, and 940,000 workmen are employed in the indnstry, the aggregate of whose wages reaches $600,000,000.

SCIENTIFIC PROGRESS.

Aluminum.

We extract and condense from an article in a late nnmber of the *Iron Age* some interesting facts in regard to this metal.

Seventeen years have passed since Deville first produced nlnminum on a commercial scale; bnt the expectations regarding this very interesting nud meritorious invention of tho distingnished French chemist have not as yet been fnlfilled. Althongb many of those expectations was somewhat exaggerated, they were not and are not so unreasonable as many people believe them to he; for a metal with so many valuable propertics would be useful in many of the technical arts. Among these properties are a beautiful color that does not change in the air, nor yet in sulphurous exhalations, and further, remarkable lightness, an agreeable reasonance, and a capability of being worked into any shape. Moreover, in the use or manipulation of aluminum there have not hitherto been observed nny deleterions effects.

It is generally conceded that the cost, and not the absence of properties which make other metals valuable, has prevented the more extensive application of aluminnm; and the price, although it is considerably less than it was at first, has remained higher during the last few years. The cost of production of this metal, which can only be extracted by the use of sodium, cannot possibly be the only cau e of its high price; for the commercial manufncture of sodiniu may be considered as a solved problem, and, as soda ash is very cheap, sodium might be produced at a moderate cost if the demand were greater than it is. Large production is caused by large consumption, and the use of aluminum has been hitherto limited, mainly because cnstom and use have opposed the introdoction of snch a novelty. Stories have been told and written about poisoning by cooking vessels made of copper, by glazings containing lead, and the formation of verdigris on spoons of (alloyed) silver; and if people were only determined to produce these utensils from aluminum, all danger from poisoning would be removed, and they would have vessels the appearance and durability of which would scarcely leave anything to desire. They would be more convenient to handle than our light cockery ware, for they can be made as light, and, what is important, cannot be broken. Splendid pitchers, plates, goblets, lamps, etc., might be manufactured from deadened and embossed alnminum; and the lightness of spoons of this metal would make them more convenient than those of silver now in use. In this case it is not the price, bnt only prejudice, which presents itself as a drawback, for the price is only half of that of good silver; beside, the difference in the specific weights of both metals and the consequent cheapness in the use of alnminnm are so great that, for the valne of one silver spoon, at least seven equally large aluminum spoons might be bought. True, aluminum is neither a rare nor a noble metal, bnt it possesses, nevertheless, advantages over alloyed silver which give it a much finer appearance; it does not get black, nor does it form verdigris, and what it lacks in brilliancy and appearance is well compensated for in its agreeable lightness. Bnt, unfortunately, it has been found impossible to plate with alnminum either by the electro-galvanic or the foil method.

In China, very few physicians employ opium for therapeutic pnrposes, though the drug plays an important part throngh its effects upon the customs and hygiene of the nation. In smoking opium, the taste at first is not nnpleasant; but as is the case with tobacco, a person must become habituated to its nse. The drug is prepared in a semi-finid state and has a sweet, oily flavor somewhat resembling rich cream. Smoking the substance for the first time, not over 130 to 150 grains per day can be nsed, as it is apt to cause violent vertigo, nausea, and headache. The first puffs render the smoker loqnacious, then he becomes stupidly happy, and finally palenese and quick contractions of the face ensne. The seueations and dreams differ according to the temperament and nervons organization of the ueer. A deep eleep is generally produced, lasting from two to three houre, during which time the pulse is low and very feeble. The physical effects are loes of appetite, extreme emaciation and frequently idiocy.

Investigation has been made in regard to the influence of changes in barometric pressure on animal life. M. Bert finds that oxygen is a "powerful poison when its proportion in the arterial blood reaches 35 c. c. per 100 c. c. of the liqnid; the poisoning characterized hy various convulsions which are due to increased excito-motor power of the spinal cord, and the process attended by diminntion of internal temperature."

In comparing the inorganic constituents of of sound and diseaeed potatoes, it is fonnd that in the dieeased root the amount of potassium, chlorine, and eulphuric acid increaees, the soluble phosphoric acid decreases. In good potatoee the starch granules are well developed; in diseased, they are fewer and smaller. The diease seems to be constitutional, including the entire plant.

The Approaching Transit of Venus.

English astronomers are not nnanimons as to the situations that promise to be most convenient for the observations of the transit of Venus in 1874—Mr. Proctor nrging certain sites, which are not approved by the Astronomer Royal. Mnch satisfnction is expressed on hearing that M. Flonrien, an experienced naval officer and competent observer, will be sent to the Marquesas hy the French Government. On this side of the Atlantic, it is promised to secnre photographs of the transit wherever the snn is ten degrees above the horizon, throngh the entire duration of the phenomenon, and wherever the effect of parnllactic displacement is most pronounced. It is assumed that there will be leading stations at Wladiwostsk, near Yokohama and Pekin, and in some other portions of China, Japan or the adjacent isles, and also in one of the Sandwich Islands. The Germans will occupy three principal stations and eight subordinate ones, while Russia will fill no less than twenty-seven stations, scattered through Eastern Siberia, and stretching between the Caspian Sea and the mouth of the Amoor, at all of which first and last contacts will be observed. In addition to the preparations made in England at the cost of the State, Lord Liudsay intends to visit the Mauritius at the time of the transit, with a good equipment of instruments, and to provide with his own hands and staff for more than one form of observation. With regard to the alliance of photography with the transit observations, Dr. Warren de la Rue and Professor Bond of the United States hold that the measurement of the photographic images of the transit will in all probability give results of three-fold higher value than any direct eye and hand observation that could be secured.—*Ex.*

The recent discovery of an inscription pillar on the shore of the Red Sea by a dragoman of the French consulate at Jerusalem, is mentioned by the London *Standard*. That stone has been purchased hy the French Minister of Public Instruction for 20,000 francs, of which 12,000 francs will be furnished from the funds of the Museum of Antiquities at the Louvre, and the remainder hy the Ministry, and in a few days, after an indispensible repair, it will be placed in the Judaic collection. This relic of King Mesha is earlier by several centuries than the celebrated tomb of the Phœnician King Eshmunezar, and bears an inscription in which the King of Moab relates, nearly nine centnries before Christ, his battles with the King of Israel.

The Function of Gums in Plants.—From experiments made with pyrogallic acid, Struve concludes that gums perform a function in plants analogous to that of blood in animals. Pyrogallic acid in contact with alkalies oxydizes rapidly, becoming a dark brown color; with other substances, such as gum arabic and blood, the oxydization is slow, a yellow color is produced, and long needle-like crystals form, which are insoluble in water. The least trace of this yellow substance produces an intense blue with ammonia or other caustic alkalies. The exact composition of this curious substance has not yet been ascertained.—*Prince Edward Islander.*

Manganese a Substitute for Nickel in the Arts.—In view of the present high price of nickel, Dr. Percy, the eminent metalurgist, proposes to substitute manganese for it in preparation of German silver, and maintains that it is impossible for the most experienced manipulator to determine the difference, except chemically. A further article on this subject in the *Chemical News*, indicates the best method of obtaining manganese sufficiently pure for the pnrpose, as also for refining it; and it is there suggested that there is nothing to prevent pure metal being obtsined in large quantity, and at a comparatively low price.

From the investigations of Dr. W. Pfeiffer, it appears that the yellow rays of light possess the highest power of decomposing carbonic acid in plants. The actiou of the other rays decresses rapidly in proportion to their distance from the yellow in the spectrum, but this decrease is greater in the rays of greatest refraction. Thus, taking the decomposing power of the yellow as 100, that of the green will be 37.2; blne, 22.1; indigo, 25.4; violet, 7.1. On the side of lese refrangibility, we have orange, 63.0; red, 25.4.

Action of a Light on Olive Oil.—Expoeure to light, though not changing its density, makes it entirely colorless. Olive oil contains normally a coloring material which acids turn yellow, and which is changed by sunlight so as to be unrecognizable. Free acid is formed at the same time hy the actiou of light and oxygen, and the oleine takes characteristic propertiee of oloidiue. The blanched oil has an acid reaction, is feebly rancid, and dissolves magenta color with avidity.

A method for the reproduction of deeigns, engravings, etc., on paper by meane of ferrocyanide of potaesium is announced. Paper prepared with this salt will be affected by the light, so that when the light is transmitted throngh a design or picture, a copy will be obtained, which ueede only to be waehed to be preserved.

Volatilization of Iron.—Dr. Elsner, of Berlin Porcelain Works, has fonnd that iron was volatilized hy exposure of many hours in a porcelain furnace, the temperature of which he states ae 3,000° C.

MECHANICAL PROGRESS.

Phosphor-Bronze.

This new alloy, which has been recently bronght before the public for ohvions reasons, is likely to be mnch patronized, especially in mannfactures where steel is nseless or dangerous. The reasone given hy the patentee are that it can bs made, according to ths wish of the operator, more ductile than copper, as tough as wrought-iron or as hard as steel; it possesses great floidity; its homogeneity is complete, and its grain is as fine as that of cast steel. It may be perfectly controlled to suit auy particular pnrpose for which it is intended, it can be made either hard or soft, tough or brittle, and its ductility, elasticity, or hardness can he regulated with the most perfect accuracy. Unlike other alloys, it can be remelted without any material loss or alteration of its quality, while heavy steel castings, when worn out or broken, are comparatively worthless.

A great variety of objects hitherto worked in iron and steel may be cast in the new alloy, and in many cases they reqnire only a polish to make them ready for nse; besides which they do not corrode, as articles of iron or steel do. Tbe great fluidity, compactness, and fine grain, as nlso tbe beautiful color of the metal, especially recommend it for decorative art, and the perfection of the castings greatly reduces the cost of chasing and finishing. This alloy stretches more than copper or auy of its ordinary compounds, and plates have been reduced, by a single cold rolling, to one-fifth of their thickness, the edges remaining perfectly sound and without crack. But perhaps the greatest advantage of phosphor-bronze is its incapacity to emit sparks. Tools, knives, scissors, and other articles, such as locks, keys, etc., have therefore already been largely made from it by gunpowder manufacturers. Bearings, pit ropes, telegraph-wire, tnyéres, cannon, cartridge-cases, pistols, bells, etc., have also been made of this metal.

By order of the Prussian Ministry of Commerce, experiments have been made with the varions kinds of phosphor alloy, the object of which was to attain the resistance of the metal to repeatedly applied strains or pulls, and also to bends of a given force. The first bar fixed on the stretching machine resisted 408,230-of ten tons per square inch, while a bar of ordinsry bronze broke before even the strain of 10 tons per square inch had been attsined. Another bar withstood 147,850 pulls of 12½ tons per sqnare inch. Still more favorable results have been obtained ou a machine by which the test bar was bent as often as 40,000 times per day. In this instance it resisted 862,980 bends of 10 tons per square inch, while the best gun-metsl broke after 102,650 bends of the same force. Another bar which was being tested withstood 1,260,000 bends of 9 tons' force per square inch, without showing any signs of weakness.

The foregoing remarks show the great adaptability of phosphor-bronze for all articles hitherto manufactured of ordinary bronze or gun-metal, and although the primary cost may exceed that of other alloys, the ultimate result will be in its favor, owing to its extra durability, lightness, and c.p bility of reconversion. In fact it may be said that what steel is to cast-iron, phosphor-bronze is to ordiuary bronze. The patentees have received diplomas and medals of merit and progress from the Vienna Exhibition.—*Iron.*

Making Hay While the Sun Shines.

An old inventor who found himself, after all his thonght aud labor, with barely the means snfficient to protect his last years from want, once gave this excellent piece of advice to young inventors: "Make your hay while the sun shines." We think we have heard this expression before, bnt it is good connsel, and, as regards inventors, particularly those who devote themeelves to improvements in printing machinery, ie greatly needed. In the present progressive etate of the business, all that can be used to facilitate printers' work is preesed into the service. Bnt if the inventor is slow, or waite too long to get his work perfected, the chances are very largely in favor of hie being snperseded by others, or that there will no longer be the same need as heretofore for the invention. The valnable work of most new inventions is said to be crowded iuto three, or at furtheet four years. The rest of tbe time ie spent in introducing the article at firet, or fighting imitatione at the last. Every day becomee precious, and ehould be employed. The appliancee of printiug machinery, the feedere, folderе and grippers, and the inking, wetting, counting and addressing machines, to say nothing of the radical prese improvemente, occupy the whole attention of probably not lese than two thousand inventing minds at the preeent time. Some of these will find themselvee behind hand with a piece of work that might have brought them a good sum. We have heard of enough instances of this kind to create the belief that there are a great many that we do not hear of. The lessons to be learned are "to make hay while the sun shines," and that in inventions no amonnt of genius will compensate for the want of enterprise.

Vapor Power.

The Boston *Globe* says: Mr. William Wells, of Salem, has just perfected an apparatus for running stationary or locomotive engines hy vapor power, which, if it fulfills all that is expected of it, will entirely revolntionize the method of running engines of every description. The new apparatus was set np a few days ago, and pnt in practical operation for the first time, in the presence of several gentlemen well versed in machinery and the npplication of power. The working of ths engine was entirely satisfactory, and all present expressed themselves as highly pleased with the snccess of the invention, which has been cousidered by all but the designer as an experiment.

The whole apparatus is very simple in construction, and the new power can be applied to any engine. The whole peculiarity in construction is in the boiler, the vapor being conveyed to the cylinder of the engine just the same as steam. The boiler is an upright one, and is really a double boiler; that is, it has two heads at each end, one a few inches from the other. The two chambers thus formed, one at each end of the boiler, are filled with water, and are connected by tubes, which are for the circulation of the water between the two chambers. The second or inner boiler, that between the two inner heads, is filled with a preparation of bisulphide of carbon, the vapor from which is the motive power and takes the place of steam. Beneath the boiler is a small fire box, from which fines rnn np through the two boilers to the smoke pipe. These flues pass inside of the tubes already mentioned, and the fire in passing through heats the chemicals. By this arrangement it will be seen that the bisulphide in the inner boiler receives the reqnisite amount of heat without coming in direct contact with the fire fines, as the water, as has been explained, is kept in circulation through the tnbes. Mr. Wells claime that with a comparatively small fire a great amount of power can be obtained, and it has been practically sbown tnat with the water at a temperature of 212 degrees Fahrenheit, or the boiling point, a pressure of sixty-five pounds to the sqnare inch is obtained on the vapor boiler, and, of course, if a greater heat is applied to the water, the vapor pressure will increase proportionately. It shonld be mentioned that the chemical preparation is nsed over many times, as the vapor, after passing throngh the cylinder of the engine, passes into a condenser, and is then returned to the boiler to be used again. The waste of chemical material is said to be very small. It is estimated that at least two-thirds of the amount of fuel can be saved by the use of this invention, but the exact amount can be better determined after further experiment.

A fireless locomotive for street cars was tested in Chicago the other day. The motive power consisted of a boiler eight feet long by three feet in diameter, and the usual machinery on a small scale. There was no fuel, no fire, no fireman. The steam was supplied for the round trip of six miles before starting. At the depot was a supply boiler thirteen feet by three feet, in which steam was generated until 200 pounds pressure was indicated by the steam gauge. The locomotive boiler was three-fourths full of cold water. Instead of boiling this by means of a fire, and raising the pressure to the required hight, the heat was introduced from the supply boiler through an iron tube. This tube was connected with a tube in the locomotive boiler, the latter running under the water along the bottom of the boiler, and letting out the superheated steam as it was freed from the supply boiler into the locomotive boiler. This steam rising through the cold water, permeated it and quickly raised its temperature to 170 degrees. With this supply of steam the engine drew a heavy four-horse car six miles, at the rate of eighteen miles an hour, and had fifty-seven pounds of steam still remaining. The test was considered perfectly satisfactory.

Slate Paint for Roofing.—At length an invention has been made that is much needed for warm climates, and particularly Cnba and the other sngar countries, where so many fires constantly occur on the estates, caused by inflammable roofing covered with some composition of pitch. The slate paint being cheap, it ie within reach of the means of the people at large, thns commending itself both to the hnshandman and to the planter that may wish to protect their roofs from damage by water and fire. The principal ingredient of the paint is slate in solution, which, within a month from the time it ie put on, cryetallizes and hardens in the open air, thue furnishing a sort of iron-clad coat, which hae penetrated into the interstices of the roof everwhere.—*El Cronista.*

Among the recent iugenious devices for ntilizing the electric spark, ie that which eubstitutes it for the ordinary flint or percnssion cap on fire-arms. By the aid of a small galvanic battery, within the handle of the pistol or gun, or by the convenient arrangement of a Leyden jar and rnbber, the cnrrent ie generated, and conducted by a wire to the cartridge. The contact of the wire with the cartridge may be effected by a simple press-pin or lever.

It is said that glycerine mixed with the water in steam engine boilers prevents the disposition of lime ealts, and consequently protects the boiler from incrustation. Abont one pound of glycerine to every 300 or 400 pounde of coal burnt ie sufficient for this purpose.

Weekly Variations in Stocks.

Our Weekly Stock Review.

THURSDAY EVE., Oct. 2d, 1873.

The past week has not been a very good one for the brokers here, as there has been a feeling of distrust in stock circles, on account of the recent financial disturbances in the Eastern States. The panic is now, however, well nigh over and affairs will shortly again pursue the even tenor of their way. As soon as the news from New York was received here, there were expectations of a great break in the market, but it did not break worth a cent. Still the banks called in their available loans and the brokers prepared for the worst, so that if a run had been started, they would have been all right. This serves to account for the extreme rate of discount ruling for silver bars. The banks wanted their coin in their vaults and did not care to buy even gold bars, much less silver. This subject is referred to more at length in another column. The lesson taught by the New York Stock Exchange of suspending business to prevent a causeless depreciation of values, will probably be followed elsewhere on similar occasions, and do much good. There have been no failures or suspensions here in consequence of matters going as they have in New York.

A recent affair in stock circles in this city is thus told by the *Real Estate Circular*, which is responsible for the story. We give it as a matter of interest to our readers: The risks attending the loaning of money on even the best class of mining stocks, and a specimen of the morals prevailing in stock circles, are well illustrated by the following story: Au attempt was made not long since to

Take Control of the Savage Mine

From certain large operators in whose hands it has for some time been. To accomplish this it was, of course, necessary to secure large loads of Savage stock. Under the influence of these purchases the stock went up to $160. About this time, however, it was found that a controling interest in the mine could not be had; that the opposite party was a little too "hefty" to be thrown overboard. The move was, therefore, a failure, and a fall in Savage was not far off. One of the buyers, who wae loaded down to the guards with the stock, wae well aware that if he were to attempt to sell out, prices would break terribly, and, being a moral genius in his way, he

Devised a Plan

To let himself down easily and put the losses on other shoulders. Calling in the aid of an unscrupulous and impecnnious individual, he made a stuffed sale of 2,600 shares of Savage to him. He then sent him to two of our largest moneylenders to borrow on the stock. One of them loaned $95 per share on 1,000 shares, at 2 per cent. per month, while the other loaned $105 a share on 1,600 shares, at 3½ per cent. per month; the first loan amounted to $95,000, the other to $168,000. 2,600 shares having thns been disposed of, the sharp operator then let the remainder of his load go upon the market. The price, of course, began to fall, but he got out with comparatively little lose. The stock in three days went down to $45. Both the money-lenders

Rushed After the Borrower

When the tumble began, but he coolly told them he had no money; that the unexpected fall in the stock had set him naked on the bedrock; and, finding nothing to attach the lenders had to grin and hear it, not knowing that what is called a neat job in the stock market had been put up on them. One of the lendere sold out at $45, sustaining a lose of $50,000; while the other has his little bnndle still on hand to say his prayers over. This little incident is a true story of unsophisticated brotherly kindnees. If its relation here ehonld be the means of inducing any widows or orphans to withdraw their little savings from a slow-going bank and invest it in mining etocks (where they are sure to double their money) onn benevolent object will he more thau attained.

This does not prove anything at all against mining stocks. It only proves that there are diehonest men in stock ciroles as in all others. The business is one which gives snch men a chance to deal unfairly, but when they do it once the brokers know them, and they never have another chance. Thievee will he thieves anywhere, and no one would take more trouble to eliminate this class of people from society than the brokers themselves.

On Friday the etock market was very weak, and the Board adjourned early to celebrate its eleventh anniversary with an approprate collation. Advices from the East concerniug the financial depression there broke down prices to some extent.

Saturday, prices opened a little better than they were on the previoue day, aud prices ou the street were even better than in the Board.

On Monday the market was quiet in the morning, but more husinese was done in tbe afternoon at steady pricee. There was, however, very little ectivity manifeeted.

Belcher was 50 cts higher than on Saturday, Chollar, $1.50; Raymond & Ely, $1; Jacket, $1.

As far as the amount of business was coucerned, Tuesday was a little better thau Monday, but prices were firm, and the enconraging news from the East in relation to the end of the "financial panic" gave a better tone to the market. Pricee closed generally higher. Ophir rose $6; Belcher, 75 cts; Chollar, $1; Savage, $1; Yellow Jacket, $1, Seg. Belcher, $1; Golden Chariot, $1.

On Wednesday there was some considerable activity in the stock market, and higher prices prevailed, the afternoon Board being quite strong. Belcher closed $1 higher, Crown Point, $1; Savage, $1; Overman, $2; Yellow Jacket, $1; Caroline, 50 cents.

Mining stocks to-day are irregnlar. Ophir shows a reaction. Overman and Segregated Belcher exhibit a hardening tendency. Compared with the rates yesterday noon, Consolidated Virginia advanced $5, Segregated Belcher $6, Alpha, Belcher, Baltimore Consolidated, Caledonia and Overman each $1. Ophir declined $4 and Savage $1. At the Board last evening, Goldeu Chariot advanced $3, Raymoud & Ely $2 and Rye Patch $1, and Hayes declined $2.

There is rather more business in Mining Stocks, notwithstanding the unsettled condition of finances, the sales at the San Francisco Stock Board for the week ending on Tuesday evening, amounting to $2,006,000, an iucrease of $200,000 over the previous week. Overman was the leading feature, the sales of which were 14,800 shares at $9 to $14 ae extremes. The next heaviest operations were in Newark and Hayea, eay 8,600 and 8,200 sharee respectively. Other large transactions embraced 4,800 shares Belcher, 4,200 sharee Baltimore Consolidated, 5,300 shares Belmont, 4,200 shares Gould & Curry, 4,600 shares Imperial, 4,500 ehares Meadow Valley, 5,700 shares Ophir and 4,600 shares Tyler.

THE *Plumas National*, published at Quincy, Plumas County, in this State, completed its seventh volumne on the 27th nlt. The *National* is one of our most valned interior exchanges.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

Silver Glance.—Alpine *Miner*, Sept. 20: In the Silver Glance Department of the M. & N. W. everything is progressing satisfactorily. Connection has been made between the boiler and engine, but owing to some delay in procuring wrapping for the pipe, the steam pump and hoisting works will not be put in operation for a few days yet. Men are at work timbering the shaft. The rock in the face of the west drift seems to be improving, and the work goes on satisfactorily.

Silver Mountain.—There is nothing new for us to present to our readers from this district. Several old claims that had been abandoned, are now being worked, and with every prospect of rich developments. Some good-looking quartz was on view in town a day or two since, taken from the Noble claim, owned by Mr. Wm. Brown, which proves to contain a fair proportion of silver, when assayed by Mr. Hunter.

The Schenectady Mill.—This mill is kept at work on ore from the upper dump. There has been a scarcity of water in the creek, which has compelled short work a part of the time. Mr. Hunter showed us a fine batch of amalgam, the result of last week's run, which he says weighs 126 pounds. This looks like success, and we have no doubt Mr. H. will realize handsomely from his present run. There will be no clean-up for some time to come.

Mills Running.—The Exchequer and Schenectady Quartz mills are now running steadily.

AMADOR COUNTY.

Placer Mines.—Amador *Ledger*, Sept. 27: Placer mining has nearly ceased throughout the county for the want of water; this want we hope will be fully met before another summer by the completion of the Sutter canal. The future prosperity of the county in a great measure depends upon this canal, and every encouragement should be given to its early completion. We hope ere long, we will be able to chronicle the important fact, that work has been resumed upon it.

Butte City.—Just below Big Bar is located the claim of the Hageman Brothers. They have the river turned by fluming, and the necessary machinery in operation to drain the bed of the stream, and are realizing more than ordinary wages. The ground has never before been thoroughly worked, and in some places never worked at all, and when these spots are found they prove to be very rich. The character of the gold is very fine, and during the early days of mining, with rocker and long tom, only a portion of the dust could have been saved. The present method of saving the finest particles of gold, renders river mining more profitable than when the primitive systems were in use, and when not more than three-fourths of the fine gold was saved.

Middle Bar.—The gravel claim of Mr. McKinney, adjoining the river, is paying well. The dirt is from 10 to 15 ft. deep, is very compact, and all contains gold. As soon as a face to the claim was secured, powder was brought into requisition to shatter and throw down the heavy banks of earth. A shaft is sunk some 20 ft. from the face, and then loaded with the requsite amount of powder, which being properly arranged, executes its mission most satisfactorily.

The Casco Mine, which is being worked by Mr. McKinney, is at present, as it has been for some time past, yielding a handsome profit. Mr. McK. took charge of the mine more than two years ago under the most unfavorable auspices. In consequence of the low stage of the water in the river, and its continual failing, it is thought the crushing of the rock will soon have to be suspended until the river rises sufficiently to afford the amount of water necessary to run the mill successfully.

As the State of Maine Mine becomes more thoroughly developed, its favorable indications of a future good mine are more surely apparent. The main shaft has attained the depth of 120 ft., at the bottom of which a level to the north is being run, which has at present reached 42 ft., with much better prospects than the mine has ever indicated.

CALAVERAS COUNTY.

Coal.—Calaveras *Chronicle*, Sept. 27: Samples from the Lancha Plana coal fields of Calaveras county, now brought to the surface of the ground, are said to be equal to the best Diablo coal.

Coal.—We have had samples of Lancha Plana coal practically tested by blacksmiths here. They welded several pieces of iron in a fire made by the Lancha coal, and did as good work as one often sees. The coal, however, still contains impurities, sulphur predominating.

A Promising Mine.—The Sanderson mine, near Railroad, is now showing better than ever before. At the depth of 180 ft. the ledge is about 3 ft. thick, and the rock is said to be the richest ever mined in that section of the county.

Cleaning Up.—Since the water in the ditch failed, Duryea, proprietor of the great hydraulic in Chili Gulch, has been making a general "clean up."

Gwin Mine.—A contract for sinking the main shaft in the Gwin mine 100 ft. deeper has been let and the work commenced. Good rock is being taken from the stopes in the 700-foot level, and a battery of 24 stamps is in active operation. We believe that the sinking of the shaft will demonstrate the fact that the rich body of ore now being mined in the 700-foot level is permanent.

Wolverine.—We learn that the work of sinking the shaft in the Wolverine mine, near Railroad, 200 ft. deeper, has been commenced. The shaft is now down 300 ft. It is supplied with first-class machinery, hoisting works, etc.

EL DORADO COUNTY.

Splendid Quartz. — Mountain *Democrat*, Sept. 27: Within the past week we have seen some extraordinary gold-bearing quartz taken out from the ledge back of Ollis' blacksmith shop. Numerous large chunks are richly seamed, studded and spangled with the precious metal. The rock is coarse-grained and friable, in occasional streaks well loaded with sulphurets, and in most of its characteristics gives promise that the ledge will develop into profitable permanency.

Good Reports.—McNevin, of the St. Lawrence mine, was in Placerville the other day, and reports excellent ore in the lower levels of that fine mine.

INYO COUNTY.

The Cottonwood Flume.—Inyo *Independent*, September 20: Over one-third of this important work is now in running order, and but a week or two will elapse before all of the most difficult portion of the cañon will be passed and the wagon road reached. Timbers 24 ft. in length go down the flume without the slightest difficulty. Flume sections or boxes 12 ft. in length are put together at the mill, put in the water and are often ridden down upon by the men. In places the flume has a grade of 4 to 12 ft, and as may be inferred boxes and men go down with fearful velocity, at times throwing water like a cannon shot. The flume will be completed before the middle of December.

Lida and Gold Mountain.—The Austin company have commenced work on their mines at Gold Mountain. The mines in Sylvania district are looking exceedingly well, all the mine owners being hard at work and in the highest hopes. At Lida, Hiskey & Walker's mill is constantly running to its fullest capacity.

Nevada.

BRISTOL DISTRICT.

Sultan.—This mine looks as well at present as it ever did. A prospecting shaft is being sunk, and no ore is at present being taken out. It is feared that work will have to be suspended until Winter on account of the want of water for the men.

Cave.—The appearances are very encouraging. There is every indication that a large body of ore will be struck soon.

CHERRY CREEK DISTRICT.

Gentlemen lately in from this new mining district are sanguine of its future prospects and one party brought in most tangible proof of there being silver and gold contained in the rock of that section. We saw 8 bars of bullion produced at the new 5-stamp mill built by the Rye Patch Consolidated Company, which were valued at $5,000, being in silver and gold, 800 fine. It will be remembered that the principal mine embraced in this company's property is the Exchequer, which has been bonded for $40,000, to Gashwiler, Boyd & Co. With such evidences as are contained in these precious bars mentioned, it would seem there should be no trouble in disposing of the property at the low figure named. We are informed that an offer has been made by the owners of the Tehama mill, at Shellburn, to remove the mill to Cherry Creek and put it in order, provided the owners of a valuable property will make a deed to the company of an undivided one-half interest. Everything looks favorable for a decidedly prosperous future for Cherry Creek, and, if the mines continue to show as well at a depth as now seems the case, the inhabitants of Shellburn, who are more or less interested at the former place, may well hope to retrieve their misfortunes, and get back some of the coin lost in wild speculations. The number of people is said to be daily increasing, and confidence seems unabated. Ere the winter's season fairly sets in we are confident other companies will be formed, and enlarged milling facilities be introduced, which will have an effect to remedy the evils consequent on the hard times heretofore prevailing there. We have to await the coming of another spring before much observable difference can be made apparent in our county, but the times look forward to increased activity in mining matters all over the State during the coming year.

ELY DISTRICT.

Meadow Valley.—Pioche *Record*, Sept. 28: About the usual quantity of ore is being taken out. Shaft No. 3 is being sunk and is now 82 feet below the ninth station. The work is being pushed ahead as fast as the nature of the ground will permit. A drift is being run to the west from the ninth station, and it is now in a distance of 116 ft., with favorable indications. The east drift from the same station is now excavated a distance of 198 ft., and is being continued. The appearances in this drift are also very favorable.

Raymond & Ely.—The miners in the drifts to the south and southwest have not, as yet, struck the ledge, though it is expected that they will come upon it at almost any hour. All the stopes from the sixth level to the third, inclusive, are in first-class ore. The ore at the eighth level is also of a very good quality. The perpendicular shaft is now 910 feet deep.

Pioche.—The company is now working 30 men. Five tons of ore, four of which are first-class, are taken out daily. There are now on the dump 90 tons of first-class ore ready for milling. The crushing of this will be commenced about the 1st of October. The work in the new shaft is progressing finely, the hoisting being done with a whim. The grading for the new building will be finished in a few days, and new steam hoisting machinery will be put up. The shaft was 272 feet deep yesterday morning, and the ground at the bottom is fair for working.

American Flag.—The shaft is being sunk at the rate of eighty feet per month. The ledge at the bottom is four feet wide, and its appearance is very encouraging. The workmen have not been without ore for the past two months; but the quantity was not sufficient to pay for extracting it. The mill is now running on ore from the Newark mine.

Spring Mountain Tunnel.—Sinking continues without any important change since the last report. Indications show the workmen in the bottom of the shaft to be near ledge No. 2. There are stringers of quartz and ledge matter coming into the bottom of the shaft, and it is expected that No. 2 will be cut before a progress of 20 feet or more shall have been made.

Chief of the Hill.—A progress of 14 feet has been made in the west drift, and 10 feet in the shaft, which is now 342 feet below the level of the Burke tunnel. The company is working 35 men. A little ore is being taken out, and work is going on as rapidly as possible all the time.

Chief East Extension.—The ledge is about the same width as last reported, and there is no change in the quality of the ore. Some ore is being extracted and assorted on the dump. There are now about 20 tons of ore ready for the mills.

Washington & Creole.—The company employ 35 men. The last of the ore on the dump was shipped last week. Bullion shipments will commence on Monday next.

Alps.—The workmen are running a prospecting drift south, and are now 360 feet from the shaft. They will have to go 60 or 70 feet further to strike the vein. From the second level a winze is being sunk in a vein 6 feet wide, of $80 or $90 ore.

Havana.—Nothing will be done in the mine until the whim, for which the grading is now being done, is erected.

Ivanhoe.—The shaft is being sunk and timbered in a substantial manner. It is now more than 100 feet deep.

Pacific Tunnel.—To-day a survey will be begun preparatory to the commencement of work.

Peavine.—The new shaft in the ledge is now down 104 feet. At the bottom there is a narrow vein of very rich ore.

Chapman.—Sinking on the vein continues with some improvement during the week. The workmen are now down to the 420-foot level.

Caroline.—Sinking is continued at the rate of four feet per day. No other work is at present being done.

Louise.—There has been very little change during the past week. Prospecting is being done on the 200-foot level.

Still Sinking.—The Bowery, Portland and South Side still continue to sink their respective shafts.

EUREKA DISTRICT.

Silverado.—Eureka *Sentinel*, Sept 21: John Shonebar was in town yesterday from the above mining section. Silverado is on the same range with Pinto and Maryland Wells. Mr. Shonebar is working two mines, namely, the Duquette and Rescue. He showed us the result of two assays made yesterday by Max. Moeller, the well known assayer. The sample from the Duquette assayed $754.03, and that taken from the Rescue, $863.98. Both ledges are promising, and Mr. Shonebar is sanguine that his mines will soon be recognized among the most valuable in in this section. He has an incline down on one of them thirty feet, disclosing at that depth a well defined ledge six feet in width.

Interesting Discovery.—We learn from Mr. Powell, foreman of the Bullwhacker mine, belonging to the Ruby Consolidated Company, that at the depth of some 325 feet, a granite formation has been reached on that lode, and masses of iron pyrites with some indications of silver sulphurets, have been exposed. If a vein of silver-bearing ore can be found at this depth, the mine will be likely to prove of great permanancy. At present, however, the developments, since the new strike, are not extensive enough to prove whether the shaft is in the ledge or in the country rock near it, but at all events the discovery is one of much interest, geologically considered.
